# **Quarkus Cheat-Sheet**

# What is Quarkus?

Quarkus is a Kubernetes Native Java stack tailored for GraalVM & OpenJDK HotSpot, crafted from the best of breed Java libraries and standards. Also focused on developer experience, making things just work with little to no configuration and allowing to do live coding.

Cheat-sheet tested with Quarkus 1.3.0.Final.

# **Getting Started**

Quarkus comes with a Maven archetype to scaffold a very simple starting project.

```
mvn io.quarkus:quarkus-maven-plugin:1.3.0.Final:create \
    -DprojectGroupId=org.acme \
    -DprojectArtifactId=getting-started \
    -DclassName="org.acme.quickstart.GreetingResource" \
    -Dpath="/hello"
```

This creates a simple JAX-RS resource called GreetingResource.

```
@Path("/hello")
public class GreetingResource {

    @GET
    @Produces(MediaType.TEXT_PLAIN)
    public String hello() {
        return "hello";
    }
}
```

# Gradle

There is no way to scaffold a project in Gradle but you only need to do:

```
plugins {
    id 'java'
    id 'io.quarkus' version '0.26.1'
}

repositories {
    mavenCentral()
}

dependencies {
    implementation enforcedPlatform('io.quarkus:quarkus-bom:0.26.1')
    implementation 'io.quarkus:quarkus-resteasy'
}
```

Or in Kotlin:

```
plugins {
    java
}
apply(plugin = "io.quarkus")

repositories {
    mavenCentral()
}

dependencies {
    implementation(enforcedPlatform("io.quarkus:quarkus-bom:0.26.1"))
    implementation("io.quarkus:quarkus-resteasy")
}
```

# **Extensions**

Quarkus comes with extensions to integrate with some libraries such as JSON-B, Camel or MicroProfile spec. To list all available extensions just run:

```
./mvnw quarkus:list-extensions
```

You can use -DsearchPattern=panache to filter out all extensions except the ones matching the expression.

And to register the extensions into build tool:

```
./mvnw quarkus:add-extension -Dextensions=""
```

extensions property supports CSV format to register more than one extension at once.

# **Application Lifecycle**

You can be notified when the application starts/stops by observing StartupEvent and ShutdownEvent events.

```
@ApplicationScoped
public class ApplicationLifecycle {
    void onStart(@Observes StartupEvent event) {}
    void onStop(@Observes ShutdownEvent event) {}
}
```

Quarkus supports graceful shutdown. By default there is no timeout but can be set by using the quarkus.shutdown.timeout config property.

# **Adding Configuration Parameters**

To add configuration to your application, Quarkus relies on MicroProfile Config spec.

Properties can be set (in decreasing priority) as:

- System properties (-Dgreetings.message).
- Environment variables (GREETINGS MESSAGE).
- Environment file named .env placed in the current working directory (GREETING MESSAGE=).
- External config directory under the current working directory: config/application.properties.
- Resources src/main/resources/application.properties.

```
greetings.message = Hello World
```

Array, List and Set are supported. The delimiter is comma (,) char and \ is the escape char.

## **Configuration Profiles**

Quarkus allow you to have multiple configuration in the same file (application.properties).

The syntax for this is %{profile}.config.key=value.

```
quarkus.http.port=9090
%dev.quarkus.http.port=8181
```

HTTP port will be 9090, unless the 'dev' profile is active.

Default profiles are:

- dev: Activated when in development mode (quarkus:dev).
- test: Activated when running tests.
- prod: The default profile when not running in development or test mode

You can create custom profile names by enabling the profile either setting quarkus.profile system property or QUARKUS\_PROFILE environment variable.

```
quarkus.http.port=9090
%staging.quarkus.http.port=9999
```

And enable it quarkus.profile=staging.

```
To get the active profile programmatically use io.quarkus.runtime.configuration.ProfileManager.getActiveProfile().
```

You can also set it in the build tool:

Same for maven-failsafe-plugin.

```
test {
    useJUnitPlatform()
    systemProperty "quarkus.test.profile", "foo"
}
```

Special properties are set in **prod** mode: quarkus.application.version and quarkus.application.name to get them available at runtime.

```
@ConfigProperty(name = "quarkus.application.name")
String applicationName;
```

# @ConfigProperties

As an alternative to injecting multiple related configuration values, you can also use the @io.quarkus.arc.config.ConfigProperties annotation to group properties.

```
@ConfigProperties(prefix = "greeting", namingStrategy=Namin
gStrategy.KEBAB_CASE)
public class GreetingConfiguration {
   private String message;
   // getter/setter
}
```

This class maps greeting.message property defined in

You can inject this class by using CDI @Inject GreetingConfiguration greeting;.

Also you can use an interface approach:

```
@ConfigProperties(prefix = "greeting", namingStrategy=Namin
gStrategy.KEBAB_CASE)
public interface GreetingConfiguration {
    @ConfigProperty(name = "message")
    String message();
    String getSuffix();
```

If property does not follow getter/setter naming convention you need to use org.eclipse.microprofile.config.inject.ConfigProperty to set it.

Nested objects are also supporte:

```
@ConfigProperties(prefix = "greeting", namingStrategy=Namin
gStrategy.KEBAB_CASE)
public class GreetingConfiguration {
   public String message;
   public HiddenConfig hidden;

   public static class HiddenConfig {
        public List<String> recipients;
    }
}
```

And an  ${\tt application.properties}$  mapping previous class:

```
greeting.message = hello
greeting.hidden.recipients=Jane, John
```

Bean Validation is also supported so properties are validated at startup time, for example <code>@Size(min = 20)</code> public String message;

prefix attribute is not mandatory. If not provided, attribute is determined by class name (ie GreeetingConfiguration is translated to greeting Or GreetingExtraConfiguration to greeting-extra). The suffix of the class is always removed.

Naming strategy can be changed with property namingStrategy. KEBAB\_CASE (whatever.foo-bar) or VERBATIM (whatever.fooBar).

# **YAML Config**

YAML configuration is also supported. The configuration file is called application.yaml and you need to register a dependency to enable its support:

# pom.xml

```
<dependency>
     <groupId>io.quarkus</groupId>
          <artifactId>quarkus-config-yaml</artifactId>
          </dependency>
```

```
quarkus:
   datasource:
     url: jdbc:postgresql://localhost:5432/some-database
     driver: org.postgresql.Driver
```

## Or with profiles:

```
"%dev":
   quarkus:
   datasource:
     url: jdbc:postgresql://localhost:5432/some-database
     driver: org.postgresql.Driver
```

In case of subkeys ~ is used to refer to the unprefixed part.

```
quarkus:
  http:
  cors:
    ~: true
    methods: GET, PUT, POST
```

### Is equivalent to:

```
quarkus.http.cors=true
quarkus.http.cors.methods=GET,PUT,POST
```

#### **Custom Loader**

You can implement your own <code>configSource</code> to load configuration from different places than the default ones provided by Quarkus. For example, database, custom XML, REST Endpoints, ...

You need to create a new class and implement ConfigSource interface:

```
package com.acme.config;
public class InMemoryConfig implements ConfigSource {
    private Map<String, String> prop = new HashMap<>();
    public InMemoryConfig() {
        // Init properties
    @Override
   public int getOrdinal() {
        // The highest ordinal takes precedence
        return 900;
    @Override
   public Map<String, String> getProperties() {
        return prop;
    @Override
    public String getValue(String propertyName) {
        return prop.get(propertyName);
    @Override
   public String getName() {
        return "MemoryConfigSource";
```

Then you need to register the <code>configSource</code> as Java service. Create a file with the following content:

```
/META-INF/services/org.eclipse.microprofile.config.spi.ConfigSource

com.acme.config.InMemoryConfig
```

### **Custom Converters**

You can implement your own conversion types from String. Implement org.eclipse.microprofile.config.spi.Converter interface:

```
@Priority(DEFAULT_QUARKUS_CONVERTER_PRIORITY + 100)
public class CustomInstantConverter
   implements Converter<Instant> {
     @Override
     public Instant convert(String value) {
        if ("now".equals(value.trim())) {
            return Instant.now();
        }
        return Instant.parse(value);
     }
}
```

<code>@Priority</code> annotation is used to override the default <code>InstantConverter</code>.

Then you need to register the <code>converter</code> as Java service. Create a file with the following content:

/META-INF/services/org.eclipse.microprofile.config.spi.Converter

```
com.acme.config.CustomInstantConverter
```

# **Custom Context Path**

By default Undertow will serve content from under the root context. If you want to change this you can use the quarkus.servlet.contextpath config key to set the context path.

# **HTTPS**

To configure HTTPS:

```
quarkus.http.ssl-port=8443
quarkus.http.ssl.certificate.key-store-file=keystore.jks
quarkus.http.ssl.certificate.key-store-file-type=jks
quarkus.http.ssl.certificate.key-store-password=changeit
quarkus.ssl.native=true
```

Possible parameters with prefix quarkus.http:

### ssl-port

The HTTPS port. (default: 8443)

#### ssl.certificate.file

The file path to a service certificate or certificate chain in *PEM* format. Relative to src/main/resources.

#### ssl.certificate.key-file

The file path to the corresponding certificate private key in *PEM* format. Relative to src/main/resources.

### ssl.certificate.key-store-file

The key store contains the certificate information. Relative to src/main/resources.

## ssl.certificate.key-store-file-type

The key store type. It is automatically detected based on the file name or can be set manually. Supported values are: JKS, JCEKS, P12, PKCS12 OF PFX.

## ssl.certificate.key-store-password

The password to open the key store file.

ssl.certificate.trust-store-file The trust store location which contains the certificate information of the certificates to trust. Relative to src/main/resources.

# ssl.certificate.trust-store-file-type

The trust store type. It is automatically detected based on the file name or can be set manually.

# ssl.certificate.trust-store-password

The password to open the trust store file.

#### sl.cipher-suite

A list of strings of cipher suites to use. If not provided, a reasonable default is selected.

#### ssl.protocols

The list of protocols to explicitly enable. (default: TLSv1.3 and TLSv1.2).

#### ssl.client-auth

Configures the engine to require/request client authentication. Possible values are: NONE, REQUEST and REQUIRED. (default: NONE).

#### insecure-requests

Disable the HTTP port and only support secure requests. Possible values: ENABLED, DISABLED, REDIRECT. (default: enabled).

# Injection

Quarkus is based on CDI 2.0 to implement injection of code. It is not fully supported and only a subset of the specification is implemented.

```
@ApplicationScoped
public class GreetingService {
    public String message(String message) {
        return message.toUpperCase();
    }
}
```

Scope annotation is mandatory to make the bean discoverable.

```
@Inject
GreetingService greetingService;
```

Quarkus is designed with Substrate VM in mind. For this reason, we encourage you to use *package-private* scope instead of *private*.

# **Produces**

You can also create a factory of an object by using @javax.enterprise.inject.Produces annotation.

```
@Produces
@ApplicationScoped
Message message() {
    Message m = new Message();
    m.setMsn("Hello");
    return m;
}
@Inject
Message msg;
```

#### Qualifiers

You can use qualifiers to return different implementations of the same interface or to customize the configuration of the bean.

```
@Oualifier
@Retention(RUNTIME)
@Target({TYPE, METHOD, FIELD, PARAMETER})
public @interface Quote {
    @Nonbinding String value();
@Produces
@Quote("")
Message message(InjectionPoint msg) {
    Message m = new Message();
    m.setMsn(
        msg.getAnnotated()
        .getAnnotation(Quote.class)
        .value()
   );
    return m:
@Inject
@Quote("Aloha Beach")
Message message;
```

Quarkus breaks the CDI spec by allowing you to inject qualified beans without using @Inject annotation.

```
@Quote("Aloha Beach")
Message message;
```

# JSON Marshalling/Unmarshalling

To work with JSON-B you need to add a dependency:

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-resteasy-jsonb"
```

Any POJO is marshaled/unmarshalled automatically.

```
public class Sauce {
    private String name;
    private long scovilleHeatUnits;

    // getter/setters
}
```

JSON equivalent:

```
"name":"Blair's Ultra Death",
"scovilleHeatUnits": 1100000
}
```

In a POST endpoint example:

To work with Jackson you need to add:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-resteasy-jackson"
```

If you don't want to use the default <code>ObjectMapper</code> you can customize it by:

```
@ApplicationScoped
public class CustomObjectMapperConfig {
    @Singleton
    @Produces
    public ObjectMapper objectMapper() {
        ObjectMapper objectMapper = new ObjectMapper();
        // perform configuration
        return objectMapper;
    }
}
```

# XML Marshalling/Unmarshalling

To work with JAX-B you need to add a dependency:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-resteasy-jaxb"
```

Then annotated POJOs are converted to XML.

```
@XmlRootElement
public class Message {
}

@GET

@Produces(MediaType.APPLICATION_XML)
public Message hello() {
    return message;
}
```

# **Validator**

Quarkus uses Hibernate Validator to validate input/output of REST services and business services using Bean validation spec.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-hibernate-validator"
```

Annotate POJO objects with validator annotations such as: @NotNull, @Digits, @NotBlank, @Min, @Max, ...

```
public class Sauce {
    @NotBlank(message = "Name may not be blank")
    private String name;
    @Min(0)
    private long scovilleHeatUnits;

// getter/setters
}
```

To validate an object use <code>@Valid</code> annotation:

```
public Response create(@Valid Sauce sauce) {}
```

If a validation error is triggered, a violation report is generated and serialized as JSON. If you want to manipulate the output, you need to catch in the code the ConstraintViolationException exception.

## **Create Your Custom Constraints**

First you need to create the custom annotation:

You need to implement the validator logic in a class that implements ConstraintValidator.

And use it normally:

```
@NotExpired
@JsonbDateFormat(value = "yyyy-MM-dd")
private LocalDate expired;
```

### **Manual Validation**

You can call the validation process manually instead of relaying to <code>@Valid</code> by injecting <code>Validator</code> class.

```
@Inject
Validator validator;
```

And use it:

```
Set<ConstraintViolation<Sauce>> violations =
    validator.validate(sauce);
```

## Localization

You can configure the based locale for validation messages.

```
quarkus.default-locale=ca-ES
# Supported locales resolved by Accept-Language
quarkus.locales=en-US,es-ES,fr-FR, ca_ES
```

ValidationMessages\_ca\_ES.properties

```
pattern.message=No conforme al patro
```

```
@Pattern(regexp = "A.*", message = "{pattern.message}")
private String name;
```

# Logging

You can configure how Quarkus logs:

```
quarkus.log.console.enable=true
quarkus.log.console.level=DEBUG
quarkus.log.console.color=false
quarkus.log.category."com.lordofthejars".level=DEBUG
```

Prefix is quarkus.log.

#### category."<category-name>".level

Minimum level category (default: INFO)

#### level

Default minimum level (default: INFO)

#### console.enabled

Console logging enabled (default: true)

#### console.format

Format pattern to use for logging. Default value:

%d{yyyy-MM-dd HH:mm:ss,SSS} %-5p [%c{3.}] (%t) %s%e%n

#### console.level

Minimum log level (default: INFO)

#### console.color

Allow color rendering (default: true)

#### file.enable

File logging enabled (default: false)

#### file.format

Format pattern to use for logging. Default value:

%d{yyyy-MM-dd HH:mm:ss,SSS} %h %N[%i] %-5p [%c{3.}] (%t) %s%e%n

#### file.level

Minimum log level (default: ALL)

## file.path

The path to log file (default: quarkus.log)

# file.rotation.max-file-size

The maximum file size of the log file

### file.rotation.max-backup-index

The maximum number of backups to keep (default: 1)

### file.rotation.file-suffix

Rotating log file suffix.

# file.rotation.rotate-on-boot

Indicates rotate logs at bootup (default: true)

#### file.async

Log asynchronously (default: false)

## file.async.queue-length

The queue length to use before flushing writing (default: 512)

#### file.async.overflow

Action when gueue is full (default: BLOCK)

#### syslog.enable

syslog logging is enabled (default: false)

#### syslog.format

The format pattern to use for logging to syslog. Default value: %d{yyyy-MM-dd HH:mm:ss,SSS} %h %N[%i] %-5p [%c{3.}] (%t) %s%e%n

#### syslog.level

The minimum log level to write to syslog (default: ALL)

#### syslog.endpoint

The IP address and port of the syslog server (default: localhost:514)

### syslog.app-name

The app name used when formatting the message in RFC5424 format (default: current process name)

#### syslog.hostname

The name of the host the messages are being sent from (default: current hostname)

#### syslog.facility

Priority of the message as defined by RFC-5424 and RFC-3164 (default: USER\_LEVEL)

#### syslog.syslog-type

The syslog type of format message (default: RFC5424)

#### syslog.protocol

Protocol used (default: TCP)

#### syslog.use-counting-framing

Message prefixed with the size of the message (default false)

#### syslog.truncate

Message should be truncated (default: true)

## syslog.block-on-reconnect

Block when attempting to reconnect (default: true)

#### syslog.asyno

Log asynchronously (default: false)

#### syslog.async.queue-length

The queue length to use before flushing writing (default: 512)

#### syslog.async.overflow

Action when queue is full (default: BLOCK)

## **Gelf ouput**

You can configure the output to be in *GELF* format instead of plain text.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-logging-gelf"
```

#### handler.gelf.enabled

Enable GELF logging handler (default: false)

#### handler.gelf.host

Hostname/IP of Logstash/Graylof. Prepend tcp: for using TCP protocol. (default: udp:localhost)

#### handler.gelf.port

The port. (default: 12201)

#### handler.gelf.version

GELF version. (default: 1.1)

#### handler.gelf.extract-stack-trace

Post Stack-Trace to StackTrace field. (default: true)

#### handler.gelf.stack-trace-throwable-reference

Gets the cause level to stack trace. o is fulls tack trace. (default: o)

#### handler.gelf.filter-stack-trace

Stack-Trace filtering. (default: false)

### handler.gelf.timestamp-pattern

Java Date pattern. (default: yyyy-MM-dd HH:mm:ss,sss)

#### handler.gelf.level

Log level java.util.logging.Level. (default: ALL)

# handler.gelf.facility

Name of the facility. (default: jboss-logmanage)

#### handler.gelf.additional-field.<field>.<subfield>

Post additional fields. quarkus.log.handler.gelf.additional-field.field1.type=String

## **JSON** output

You can configure the output to be in *JSON* format instead of plain text.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-logging-json"
```

And the configuration values are prefix with quarkus.log:

### json

JSON logging is enabled (default: true).

## json.pretty-print

---- data farmat

JSON output is "pretty-printed" (default: false)

Specify the date format to use (default: the default format)

#### json.record-delimiter

Record delimiter to add (default: no delimiter)

#### json.zone-id

The time zone ID

#### json.exception-output-type

The exception output type: detailed, formatted, detailed-and-formatted (default: detailed)

#### json.print-details

Detailed caller information should be logged (default: false)

# **Rest Client**

Quarkus implements MicroProfile Rest Client spec:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-rest-client"
```

To get content from http://worldclockapi.com/api/json/cet/now you need to create a service interface:

```
public class WorldClockOptions {
    @HeaderParam("Authorization")
    String auth;

    @PathParam("where")
    String where;
}
```

And configure the hostname at application.properties:

```
org.acme.quickstart.WorldClockService/mp-rest/url=
    http://worldclockapi.com
```

Injecting the client

```
@RestClient
WorldClockService worldClockService;
```

If invokation happens within JAX-RS, you can propagate headers from incoming to outgoing by using next property.

```
org.eclipse.microprofile.rest.client.propagateHeaders=
Authorization,MyCustomHeader
```

You can still use the JAX-RS client without any problem ClientBuilder.newClient().target(...)

# Adding headers

You can customize the headers passed by implementing MicroProfile ClientHeadersFactory annotation:

And registering it in the client using RegisterClientHeaders annotation.

```
@RegisterClientHeaders(BaggageHeadersFactory.class)
@RegisterRestClient
public interface WorldClockService {}
```

Or statically set:

```
@GET
@ClientHeaderParam(name="X-Log-Level", value="ERROR")
Response getNow();
```

# **Asynchronous**

A method on client interface can return a CompletionStage class to be executed asynchronously.

```
@GET @Path("/json/cet/now")
@Produces(MediaType.APPLICATION_JSON)
CompletionStage<WorldClock> getNow();
```

## Reactive

Rest Client also integrates with reactive library named Mutiny. To start using it you need to add the quarkus-resteasy-mutiny.

After that, a methodon a client interface can return a io.smallrye.mutiny.Uni instance.

```
@GET @Path("/json/cet/now")
@Produces(MediaType.APPLICATION_JSON)
Uni<WorldClock> getNow();
```

# **Multipart**

It is really easy to send multipart form-data with Rest Client.

```
<dependency>
    <groupId>org.jboss.resteasy</groupId>
    <artifactId>resteasy-multipart-provider</artifactId>
</dependency>
```

# The model object:

## And the Rest client interface:

#### SSL

You can configure Rest Client key stores.

```
org.acme.quickstart.WorldClockService/mp-rest/trustStore=
    classpath:/store.jks
org.acme.quickstart.WorldClockService/mp-rest/trustStorePas
sword=
    supersecret
```

Possible configuration properties:

#### %s/mp-rest/trustStore

Trust store location defined with classpath: or file: prefix.

#### %s/mp-rest/trustStorePassword

Trust store password.

#### %s/mp-rest/trustStoreType

Trust store type (default: JKS)

#### %s/mp-rest/hostnameVerifier

Custom hostname verifier class name.

### %s/mp-rest/keyStore

Key store location defined with classpath: or file: prefix.

#### %s/mp-rest/keyStorePassword

Key store password.

# %s/mp-rest/keyStoreType

Key store type (default: JKS)

# **Timeout**

You can define the timeout of the Rest Client:

```
org.acme.quickstart.WorldClockService/mp-rest/connectTimeou
t=
    1000
org.acme.quickstart.WorldClockService/mp-rest/readTimeout=
    2000
```

# **Testing**

Quarkus archetype adds test dependencies with JUnit 5 and Rest-Assured library to test REST endpoints.

```
@QuarkusTest
public class GreetingResourceTest {

    @Test
    public void testHelloEndpoint() {
        given()
            .when().get("/hello")
            .then()
                  .statusCode(200)
                  .body(is("hello"));
        }
}
```

Test port can be set in quarkus.http.test-port property.

You can also inject the URL where Quarkus is started:

```
@TestHTTPResource("index.html")
URL url;
```

## **Ouarkus Test Resource**

You can execute some logic before the first test run (start) and execute some logic at the end of the test suite (stop).

You need to create a class implementing QuarkusTestResourceLifecycleManager interface and register it in the test Via @QuarkusTestResource annotation.

```
public class MyCustomTestResource
    implements QuarkusTestResourceLifecycleManager {
    @Override
    public Map<String, String> start() {
        // return system properties that
        // should be set for the running test
        return Collections.emptyMap();
    @Override
    public void stop() {
    // optional
    @Override
    public void inject(Object testInstance) {
    // optional
    @Override
    public int order() {
        return 0;
```

Returning new system properties implies running parallel tests in different JVMs.

And the usage:

```
@QuarkusTestResource (MyCustomTestResource.class)
public class MyTest {
}
```

# **Mocking**

If you need to provide an alternative implementation of a service (for testing purposes) you can do it by using CDI @Alternative annotation using it in the test service placed at src/test/java:

```
@Alternative
@Priority(1)
@ApplicationScoped
public class MockExternalService extends ExternalService {}
```

This does not work when using native image testing.

A stereotype annotation io.quarkus.test.Mock is provided declaring @Alternative, @Priority(1) and @Dependent.

## Interceptors

Tests are actually full CDI beans, so you can apply CDI interceptors:

```
@QuarkusTest
@Stereotype
@Transactional
@Retention(RetentionPolicy.RUNTIME)
@Target(ElementType.TYPE)
public @interface TransactionalQuarkusTest {
}

@TransactionalQuarkusTest
public class TestStereotypeTestCase {}
```

**Test Coverage** Due the nature of Quarkus to calculate correctly the coverage information with JaCoCo, you might need offline instrumentation. I recommend reading this document to understand how JaCoCo and Quarkus works and how you can configure JaCoCo to get correct data.

# **Native Testing**

To test native executables annotate the test with <code>@NativeImageTest</code>.

# Persistence

Quarkus works with JPA(Hibernate) as persistence solution. But also provides an Active Record pattern implementation under Panache project.

To use database access you need to add Quarkus JDBC drivers instead of the original ones. At this time Apache Derby, H2, Mariadb, MysQL, MssQL and PostgreSQL drivers are supported.

```
@Entity
public class Developer extends PanacheEntity {
    // id field is implicit
    public String name;
}
```

And configuration in src/main/resources/application.properties:

```
quarkus.datasource.jdbc.url=jdbc:mariadb://localhost:3306/m
ydb
quarkus.datasource.db-kind=mariadb
quarkus.datasource.username=developer
quarkus.datasource.password=developer
quarkus.hibernate-orm.database.generation=update
```

List of datasource parameters.

quarkus.datasource as prefix is skipped in the next table.

#### db-kind

Built-in datasource kinds so the JDBC driver is resolved automatically. Possible values: derby, h2, mariadb, mssql, mysql, postgresql.

#### username

Username to access.

#### password

Password to access.

## driver

JDBC Driver class. It is not necessary to set if db-kind used.

#### jdbc.url

The datasource URL.

#### jdbc.min-size

The datasource pool minimum size. (default: 0)

#### jdbc.max-size

The datasource pool maximum size. (default: 20)

#### jdbc.initial-size

The initial size of the pool.

#### jdbc.background-validation-interval

The interval at which we validate idle connections in the background. (default: 2M)

#### jdbc.acquisition-timeout

The timeout before cancelling the acquisition of a new connection. (default: 5)

#### jdbc.leak-detection-interval

The interval at which we check for connection leaks.

#### jdbc.idle-removal-interval

The interval at which we try to remove idle connections. (default: 5M)

#### jdbc.max-lifetime

The max lifetime of a connection.

#### jdbc.transaction-isolation-level

The transaction isolation level. Possible values: undefined, none, READ\_UNCOMMITTED, READ\_COMMITTED, REPEATABLE\_READ, SERIALIZABLE.

#### jdbc.detect-statement-leaks

Warn when a connection is returned to the pool without the application having closed all open statements. (default: true)

# jdbc.new-connection-sql

Query executed when first using a connection.

## jdbc.validation-query-sql

Query executed to validate a connection.

#### jdbc.enable-metrics

Enable datasource metrics collection when using quarkussmallrye-metrics extension.

Hibernate configuration properties. Prefix quarkus.hibernate-orm is skipped.

### dialect

Class name of the Hibernate ORM dialect.

#### dialect.storage-engine

The storage engine when the dialect supports multiple storage engines.

#### sql-load-script

Name of the file containing the SQL statements to execute when starts. no-file force Hibernate to skip SQL import. (default: import.sql)

#### batch-fetch-size

The size of the batches. (default: -1 disabled)

#### query.query-plan-cache-max-size

The maximum size of the guery plan cache.

## query.default-null-ordering

Default precedence of null values in ORDER BY. Possible values: none, first, last. (default: none)

#### database.generation

Database schema is generation. Possible values: none, create, drop-and-create, drop, update. (default: none)

#### database.generation.halt-on-error

Stop on the first error when applying the schema. (default: false)

#### database.default-catalog

Default catalog.

#### database.default-schema

Default Schema.

#### database.charset

Charset.

#### jdbc.timezone

Time Zone JDBC driver.

#### jdbc.statement-fetch-size

Number of rows fetched at a time.

#### jdbc.statement-batch-size

Number of updates sent at a time.

### log.sql

Show SQL logs (default: false)

# log.jdbc-warnings

### statistics

Enable statiscs collection. (default: false)

# physical-naming-strategy

Class name of the Hibernate PhysicalNamingStrategy implementation.

## globally-quoted-identifiers

Should quote all identifiers. (default: false)

#### metrics-enabled

Metrics published with smallrye-metrics extension (default: false)

# second-level-caching-enabled

Enable/Disable 2nd level cache. (default: true)

Database operations:

```
// Insert
Developer developer = new Developer();
developer.name = "Alex";
developer.persist();

// Find All
Developer.findAll().list();

// Find By Query
Developer.find("name", "Alex").firstResult();

// Delete
Developer developer = new Developer();
developer.id = 1;
developer.delete();

// Delete By Query
long numberOfDeleted = Developer.delete("name", "Alex");
```

Remember to annotate methods with @Transactional annotation to make changes persisted in the database.

If queries start with the keyword from then they are treated as *HQL* query, if not then next short form is supported:

- order by which expands to from EntityName order by ...
- <columnName> which expands to from EntityName where <columnName>=?
- query> which is expanded to from EntityName where <query>

### **Static Methods**

## findById: Object

Returns object or null if not found. Overloaded version with LockModeType is provided.

## findByIdOptional: Optional<Object>

Returns object or java.util.Optional.

# find: String, [Object..., Map<String, Object>, Parameters]

Lists of entities meeting given query with parameters set.

# find: String, Sort, Object..., Map<String, Object>, Parameters]

Lists of entities meeting given query with parameters set sorted by sort attribute/s.

#### findAll

Finds all entities.

#### findAll: Sort

Finds all entities sorted by sort attribute/s.

# stream: String, Object..., Map<String, Object>, Parameters

java.util.stream.Stream of entities meeting given query with parameters set.

```
stream: String, Sort, Object..., Map<String, Object>, Parameters
```

java.util.stream.Stream of entities meeting given query with parameters set sorted by sort attribute/s.

#### streamAll

java.util.stream.Stream of all entities.

#### streamAll: Sort

java.util.stream.Stream of all entities sorted by sort attribute/s.

#### count

Number of entities.

# count: String, Object..., Map<String, Object>, Parameters

Number of entities meeting given query with parameters set.

#### deleteAll

Number of deleted entities.

# delete: String, Object..., Map<String, Object>, Parameters]

Number of deleted entities meeting given query with parameters set.

# persist: Iterable, Steram, Object...]

In case of using streams, remember to close them or use a
try/catch block: try (Stream<Person> persons =
Person.streamAll()).

find methods defines a withLock(LockModeType) to define
the lock type and withHint(QueryHints.HINT\_CACHEABLE,
"true") to define hints.

## **Pagination**

If entities are defined in external JAR, you need to enable in these projects the Jandex plugin in project.

```
<plugin>
   <groupId>org.jboss.jandex</groupId>
   <artifactId>jandex-maven-plugin</artifactId>
   <version>1.0.3
   <executions>
       <execution>
           <id>make-index</id>
           <goals>
               <goal>jandex</goal>
           </goals>
       </execution>
   </executions>
   <dependencies>
       <dependency>
           <groupId>org.jboss
           <artifactId>jandex</artifactId>
           <version>2.1.1.Final
       </dependency>
   </dependencies>
</plugin>
```

# **DAO** pattern

Also supports DAO pattern with PanacheRepository<TYPE>.

```
@ApplicationScoped
public class DeveloperRepository
   implements PanacheRepository<Person> {
   public Person findByName(String name) {
     return find("name", name).firstResult();
   }
}
```

**EntityManager** You can inject EntityManager in your classes:

```
@Inject
EntityManager em;
em.persist(car);
```

## **Multiple datasources**

You can register more than one datasource.

```
# default
quarkus.datasource.db-kind=h2
quarkus.datasource.jdbc.url=jdbc:h2:tcp://localhost/mem:def
ault
....
# users datasource
quarkus.datasource.users.db-kind=h2
quarkus.datasource.users..jdbc.url=jdbc:h2:tcp://localhost/
mem:users
```

Notice that after datasource you set the datasource name, in previous case users.

You can inject then AgroalDataSource with io.quarkus.agroal.DataSource.

```
@DataSource("users")
AgroalDataSource dataSource1;
```

## **Flushing**

You can force flush operation by calling <code>.flush()</code> or <code>.persistAndFlush()</code> to make it in a single call.

This flush is less efficient and you still need to commit transaction.

# **Testing**

There is a Quarkus Test Resource that starts and stops H2 server before and after test suite.

Register dependency io.quarkus:quarkus-test-h2:test.

And annotate the test:

```
@QuarkusTestResource(H2DatabaseTestResource.class)
public class FlywayTestResources {
}
```

#### **Transactions**

The easiest way to define your transaction boundaries is to use the <code>@Transactional</code> annotation.

Transactions are mandatory in case of none idempotent operations.

```
@Transactional
public void createDeveloper() {}
```

You can control the transaction scope:

- @Transactional(REQUIRED) (default): starts a transaction if none was started, stays with the existing one otherwise.
- @Transactional (REQUIRES\_NEW): starts a transaction if none was started; if an existing one was started, suspends it and starts a new one for the boundary of that method.
- @Transactional(MANDATORY): fails if no transaction was started; works within the existing transaction otherwise.
- @Transactional(SUPPORTS): if a transaction was started, joins it; otherwise works with no transaction.
- @Transactional(NOT\_SUPPORTED): if a transaction was started, suspends it and works with no transaction for the boundary of the method: otherwise works with no transaction.
- @Transactional(NEVER): if a transaction was started, raises an exception; otherwise works with no transaction.

You can configure the default transaction timeout using quarkus.transaction-manager.default-transaction-timeout configuration property. By default it is set to 60 seconds.

You can set a timeout property, in seconds, that applies to transactions created within the annotated method by using <code>@TransactionConfiguration</code> annotation.

```
@Transactional
@TransactionConfiguration(timeout=40)
public void createDeveloper() {}
```

If you want more control over transactions you can inject UserTransaction and use a programmatic way.

```
@Inject UserTransaction transaction

transaction.begin();
transaction.commit();
transaction.rollback();
```

# Infinispan

Quarkus integrates with Infinispan:

```
./mvnw quarkus:add-extension
-Dextensions="infinispan-client"
```

Serialization uses a library called Protostream.

### **Annotation based**

```
@ProtoFactory
public Author(String name, String surname) {
    this.name = name;
    this.surname = surname;
}

@ProtoField(number = 1)
public String getName() {
    return name;
}

@ProtoField(number = 2)
public String getSurname() {
    return surname;
}
```

Initializer to set configuration settings.

# **User written based**

There are three ways to create your schema:

#### Protofile

Creates a .proto file in the META-INF directory.

```
package book_sample;

message Author {
  required string name = 1;
  required string surname = 2;
}
```

In case of having a Collection field you need to use the repeated key (ie repeated Author authors = 4).

# In code

Setting proto schema directly in a produced bean.

#### Marshaller

Using org.infinispan.protostream.MessageMarshaller interface.

```
public class AuthorMarshaller
    implements MessageMarshaller<Author> {
   @Override
  public String getTypeName() {
      return "book sample.Author";
   @Override
  public Class<? extends Author> getJavaClass() {
      return Author.class;
   @Override
  public void writeTo(ProtoStreamWriter writer,
                    Author author) throws IOException {
     writer.writeString("name", author.getName());
      writer.writeString("surname", author.getSurname());
   @Override
   public Author readFrom(ProtoStreamReader reader)
        throws IOException {
     String name = reader.readString("name");
     String surname = reader.readString("surname");
      return new Author(name, surname);
```

And producing the marshaller:

```
@Produces
MessageMarshaller authorMarshaller() {
    return new AuthorMarshaller();
}
```

# Infinispan Embedded

```
./mvnw quarkus:add-extension
-Dextensions="infinispan-embeddedy"
```

Configuration in infinispan.xml:

Set configuration file location in application.properties:

```
quarkus.infinispan-embedded.xml-config=infinispan.xml
```

And you can inject the main entry point for the cache.

```
@Inject
org.infinispan.manager.EmbeddedCacheManager cacheManager;
```

# **Flyway**

Quarkus integrates with Flyway to help you on database schema migrations.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-flyway"
```

Then place migration files to the migrations folder (classpath:db/migration).

You can inject org.flywaydb.core.Flyway to programmatically execute the migration.

```
@Inject
Flyway flyway;
flyway.migrate();
```

Or can be automatically executed by setting <code>migrate-at-start</code> property to <code>true</code>.

```
quarkus.flyway.migrate-at-start=true
```

List of Flyway parameters.

quarkus.flyway as prefix is skipped in the next table.

#### clean-at-start

Execute Flyway clean command (default: false)

#### migrate-at-start

Flyway migration automatically (default: false)

#### locations

CSV locations to scan recursively for migrations. Supported prefixes classpath and filesystem (default: classpath:db/migration).

### connect-retries

The maximum number of retries when attempting to connect (default: 0)

#### schemas

CSV case-sensitive list of schemas managed (default: none)

## table

The name of Flyway's schema history table (default: flyway schema history)

#### sql-migration-prefix

Prefix for versioned SQL migrations (default: v)

repeatable-sql-migration-prefix:: Prefix for repeatable SQL migrations (default: R)

#### baseline-on-migrate

Only migrations above baseline-version will then be applied

#### baseline-version

Version to tag an existing schema with when executing baseline (default: 1)

#### baseline-description

Description to tag an existing schema with when executing baseline (default: Flyway Baseline)

#### validate-on-migrate

Validate the applied migrations against the available ones (default: true)

# **Multiple Datasources**

To use multiple datasource in Flyway you just need to add the datasource name just after the flyway property:

```
quarkus.datasource.users.jdbc.url=jdbc:h2:tcp://localhost/m
em:users
quarkus.datasource.inventory.jdbc.url=jdbc:h2:tcp://localho
st/mem:inventory
# ...

quarkus.flyway.users.schemas=USERS_TEST_SCHEMA
quarkus.flyway.inventory.schemas=INVENTORY_TEST_SCHEMA
# ...
```

# Liquibase

Quarkus integrates with Liquibase to help you on database schema migrations.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-liquibase"
```

Then place changelog files to the (src/main/resources/db) folder.

You can inject org.quarkus.liquibase.LiquibaseFactory to programmatically execute the migration.

```
@Inject
LiquibaseFactory liquibaseFactory;

try (Liquibase liquibase = liquibaseFactory.createLiquibase
()) {
    ...
}
```

Or can be automatically executed by setting migrate-at-start property to true.

```
quarkus.liquibase.migrate-at-start=true
```

List of Liquibase parameters.

quarkus.liquibase as prefix is skipped in the next table.

# change-log

The change log file. XML, YAML, JSON, SQL formats supported. (default: db/changeLog.xml)

## migrate-at-start

The migrate at start flag. (default: false)

# validate-on-migrate

The validate on update flag. (default: false)

### clean-at-start

The clean at start flag. (default: false)

#### contexts

The list of contexts.

#### labels

The list of labels.

# database-change-log-table-name

The database change log lock table name. (default: DATABASECHANGELOG)

# database-change-log-lock-table-name

The database change log lock table name. (default: DATABASECHANGELOGLOCK)

# default-catalog-name

The default catalog name.

## default-schema-name

The default schema name.

## liquibase-catalog-name

The liquibase tables catalog name.

# liquibase-schema-name

The liquibase tables schema name.

# liquibase-tablespace-name

The liquibase tables tablespace name.

# **Multiple Datasources**

To use multiple datasource in Liquibase you just need to add the datasource name just after the liquibase property:

```
quarkus.datasource.users.jdbc.url=jdbc:h2:tcp://localhost/m
em:users
quarkus.datasource.inventory.jdbc.url=jdbc:h2:tcp://localho
st/mem:inventory
# ...

quarkus.liquibase.users.schemas=USERS_TEST_SCHEMA
quarkus.liquibase.inventory.schemas=INVENTORY_TEST_SCHEMA
# ...
```

# **Hibernate Search**

Quarkus integrates with Elasticsearch to provide a full-featured full-text search using Hibernate Search API.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-hibernate-search-elasticsearch"
```

You need to annotate your model with Hibernate Search API to index it:

0

It is not mandatory to use Panache.

You need to define the analyzers and normalizers defined in annotations. You only need to implement ElasticsearchAnalysisConfigurer interface and configure it.

```
public class MyQuarkusAnalysisConfigurer
            implements ElasticsearchAnalysisConfigurer {
    @Override
   public void configure(
         ElasticsearchAnalysisDefinitionContainerContext ct
\times)
            ctx.analyzer("english").custom()
                .withTokenizer("standard")
                .withTokenFilters("asciifolding",
                    "lowercase", "porter_stem");
        ctx.normalizer("sort").custom()
            .withTokenFilters("asciifolding", "lowercase");
```

Use Hibernate Search in REST service:

```
public class LibraryResource {
    @Inject
    EntityManager em;
    @Transactional
    public List<Author> searchAuthors(
        @QueryParam("pattern") String pattern) {
        return Search.getSearchSession(em)
            .search(Author.class)
            .predicate(f ->
                pattern == null || pattern.isEmpty() ?
                    f.matchAll() :
                    f.simpleQueryString()
                        .onFields("firstName",
                            "lastName", "books.title")
                        .matching(pattern)
            .sort(f -> f.byField("lastName sort")
            .then().byField("firstName sort"))
            .fetchHits();
```

When not using Hibernate ORM, index data using Search.getSearchSession(em).createIndexer() .startAndWait() at startup time.

Configure the extension in application.properties:

```
quarkus.hibernate-search.elasticsearch.version=7
quarkus.hibernate-search.elasticsearch.
    analysis-configurer=MyQuarkusAnalysisConfigurer
quarkus.hibernate-search.elasticsearch.
    automatic-indexing.synchronization-strategy=searchable
quarkus.hibernate-search.elasticsearch.
    index-defaults.lifecycle.strategy=drop-and-create
quarkus.hibernate-search.elasticsearch.
    index-defaults.lifecycle.required-status=yellow
```

List of Hibernate-Elasticsearch properties quarkus.hibernate-search.elasticsearch:

#### backends

Map of configuration of additional backends.

#### version

Version of Elasticsearch

#### analysis-configurer

Class or name of the neab used to configure.

#### hosts

List of Elasticsearch servers hosts.

#### username

Username for auth.

#### password

Password for auth.

#### connection-timeout

Duration of connection timeout.

#### max-connections

Max number of connections to servers.

#### max-connections-per-route

Max number of connections to server.

Per-index specific configuration.

## discovery.enabled

Enables automatic discovery.

# discovery.refresh-interval

Refresh interval of node list.

#### discovery.default-scheme

Scheme to be used for the new nodes.

## automatic-indexing.synchronization-strategy

Status for which you wait before considering the operation completed (queued, committed Or searchable).

# automatic-indexing.enable-dirty-check

When enabled, re-indexing of is skipped if the changes are on properties that are not used when indexing.

# index-defaults.lifecycle.strategy

Index lifecycle (none, validate, update, create, drop-and-create, drop-abd-create-drop)

# index-defaults.lifecycle.required-status

Minimal cluster status (green, yellow, red)

index defends liferently named about the binsons

Waiting time before failing the bootstrap.

#### index-defaults.refresh-after-write

Set if index should be refreshed after writes.

Possible annotations:

#### @Indexed

Register entity as full text index

#### @FullTextField

Full text search. Need to set an analyzer to split tokens.

#### @KeywordField

The string is kept as one single token but can be normalized.

#### IndexedEmbedded

Include the Book fields into the Author index.

#### @ContainerExtraction

Sets how to extract a value from container, e.g from a Map.

#### @DocumentId

Map an unusual entity identifier to a document identifier.

#### @GenericField

Full text index for any supported type.

## @IdentifierBridgeRef

Reference to the identifier bridge to use for a @DocumentId.

#### @IndexingDependency

How a dependency of the indexing process to a property should affect automatic reindexing.

#### @ObjectPath

### @ScaledNumberField

For java.math.BigDecimal Or java.math.BigInteger that you need higher precision.

# **Amazon DynamoDB**

Quarkus integrates with Amazon DynamoDB:

```
./mvnw quarkus:add-extension
 -Dextensions="quarkus-amazon-dynamodb"
```

```
DynamoDbClient dynamoDB;
```

To use asycnhronous client with Mutiny:

```
./mvnw quarkus:add-extension
 -Dextensions="quarkus-amazon-dynamodb, resteasy-mutiny"
```

```
@Inject
DynamoDbAsyncClient dynamoDB;
Uni.createFrom().completionStage(() -> dynamoDB.scan(scanRe
quest()))....
```

# To use it as a local DynamoDB instance:

```
quarkus.dynamodb.region=
   eu-central-1
quarkus.dynamodb.endpoint-override=
   http://localhost:8000
quarkus.dynamodb.credentials.type=STATIC
quarkus.dynamodb.credentials.static-provider
    .access-key-id=test-key
quarkus.dynamodb.credentials.static-provider
.secret-access-key=test-secret
```

# If you want to work with an AWS account, you'd need to set it with:

```
quarkus.dynamodb.region=<YOUR_REGION>
quarkus.dynamodb.credentials.type=DEFAULT
```

# DEFAULT credentials provider chain:

- System properties aws.accessKeyId, aws.secretKey
- Env. Varables aws\_access\_key\_id, aws\_secret\_access\_key
- Credentials profile ~/.aws/credentials
- Credentials through the Amazon EC2 container service if the AWS\_CONTAINER\_CREDENTIALS\_RELATIVE\_URI Set
- Credentials through Amazon EC2 metadata service.

# Configuration parameters prefixed with quarkus.dynamodb:

Parameter	Default	Description
enable-endpoint- discovery	false	Endpoint discovery for a service API that supports endpoint discovery.
endpoint-override		Configure the endpoint with which the SDK should communicate.

connection-timeout		Connection timeout.	max-http2-streams		Max number of			

concurrent streams.

#### pool.max-connection-lifetime

Pooled connections older will be closed and removed from the pool. (default: 1H)

#### pool.connection-acquisition-timeout

Timout for connection adquisation. (default: 1M)

#### pool.idle-time-before-connection-test

Pooled connections idled in the pool for longer than this timeout will be tested before they are used. (default: -1)

As Neo4j uses SSL communication by default, to create a native executable you need to compile with next options GraalVM options:

```
-H:EnableURLProtocols=http,https --enable-all-security-services -
H:+JNI
```

And Quarkus Maven Plugin with next configuration:

```
<artifactId>quarkus-maven-plugin</artifactId>
<executions>
    <execution>
       <id>native-image</id>
        <goals>
            <goal>native-image</poal>
        </goals>
       <configuration>
           <enableHttpUrlHandler>true
           </enableHttpUrlHandler>
            <enableHttpsUrlHandler>true
            </enableHttpsUrlHandler>
            <enableAllSecurityServices>true
            </enableAllSecurityServices>
            <enableJni>true</enableJni>
        </configuration>
    </execution>
</executions>
```

Alternatively, and as a not recommended way in production, you can disable SSL and Quarkus will disable Bolt SSL as well.

guarkus.ssl.native=false.

If you are using Neo4j 4.0, you can use fully reactive. Add the next extension: quarkus-resteasy-mutiny.

# **MongoDB Client**

Quarkus integrates with MongoDB:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-mongodb-client"
```

```
@Inject
com.mongodb.client.MongoClient client;

@Inject
io.quarkus.mongodb.reactive.ReactiveMongoClient client;
```

# INFO: Reactive client uses exposes Mutiny API.

```
quarkus.mongodb.connection-string=mongodb://localhost:27018
quarkus.mongodb.write-concern.journal=false
```

# **Multi MongoDB support**

You can configure multiple MongoDB clients using same approach as with DataSource. The syntax is quarkus.mongodb.<optional name>.

```
quarkus.mongodb.users.connection-string = mongodb://mongo2:
27017/userdb
quarkus.mongodb.inventory.connection-string = mongodb://mongo3:27017/invdb
```

# Inject the instance using @io.quarkus.mongodb.runtime.MongoClientName annotation:

```
@Inject
@MongoClientName("users")
MongoClient mongoClient1;
```

quarkus.mongodb as prefix is skipped in the next table.

quarkus.mongodb ds pre	siix is skipped iii tile lie	ext table.
Parameter	Туре	Description
connection-string	String	MongoDB connection URI.
hosts	List <string></string>	Addresses passed as host:port.
application-name	String	Application name.
max-pool-size	Int	Maximum number of connections.
min-pool-size	Int	Minimum number of connections.
<pre>max-connection-idle- time</pre>	Duration	Idle time of a pooled connection.
<pre>max-connection-life- time</pre>	Duration	Life time of pooled connection.
wait-queue-timeout	Duration	Maximum wait time for new connection.
maintenance- frequency	Duration	Time period between runs of maintenance job.
maintenance-initial-delay	Duration	Time to wait before running the first maintenance job.
wait-queue-multiple	Int	Multiplied with max- pool-size gives max numer of threads waiting.
connection-timeout	Duration	
socket-timeout	Duration	
tls-insecure	boolean [false]	Insecure TLS.
tls	boolean [false]	Enable TLS

Parameter	Туре	Description
replica-set-name	String	Implies hosts given are a seed list.
server-selection-timeout	Duration	Time to wait for server selection.
local-threshold	Duration	Minimum ping time to make a server eligible.
heartbeat-frequency	Duration	Frequency to determine the state of servers.
read-preference	<pre>primary, primaryPreferred, secondary, secondaryPreferred, nearest</pre>	Read preferences.
max-wait-queue-size	Int	Max number of concurrent operations allowed to wait.
write-concern.safe	boolean [true]	Ensures are writes are ack.
write- concern.journal	boolean [true]	Journal writing aspect.
write-concern.w	String	Value to all write commands.
write-concern.retry-writes	boolean [false]	Retry writes if network fails.
write-concern.w-timeout	Duration	Timeout to all write commands.
credentials.username	String	Username.
credentials.password	String	Password.
credentials.auth- mechanism	MONGO-CR, GSSAPI PLAIN, MONGODB-X509	,

```
Parameter
                      Type
                                           Description
                                           Source
                                                      of
                                                             the
credentials.auth-
                                           authentication
                      String
                                           credentials.
                                           Authentication
credentials.auth-
                      Map<String, String>
                                           mechanism
mechanism-properties
                                           properties.
```

# MongoDB Panache

You can also use the Panache framework to write persistence part when using MongoDB.

```
./mvnw quarkus:add-extension
-Dextensions="mongodb-panache"
```

MongoDB configuration comes from MongoDB Client section.

```
@MongoEntity(collection="ThePerson")
public class Person extends PanacheMongoEntity {
    public String name;

    @BsonProperty("birth")
    public LocalDate birthDate;

public Status status;
}
```

Possible annotations in fields: @BsonId (for custom ID), @BsonProperty and @BsonIgnore.

@MongoEntity is optional.

Methods provided are similar of the ones shown in Persistence section.

```
person.persist();
person.update();
person.delete();

List<Person> allPersons = Person.listAll();
person = Person.findById(personId);
List<Person> livingPersons = Person.list("status", Status.A live);
List<Person> persons = Person.list(Sort.by("name").and("bir th"));

long countAll = Person.count();
Person.delete("status", Status.Alive);
```

All list methods have equivalent stream versions.

# **Pagination**

You can also use pagination:

```
PanacheQuery<Person> livingPersons =
    Person.find("status", Status.Alive);
livingPersons.page(Page.ofSize(25));

// get the first page
List<Person> firstPage = livingPersons.list();
// get the second page
List<Person> secondPage = livingPersons.nextPage().list();
```

# Queries

Native MongoDB queries are supported (if they start with { or org.bson.Document instance) as well as Panache Queries. Panache Queries equivalence in MongoDB:

```
• firstname = ?1 and status = ?2 \rightarrow {'firstname': ?1, 'status': ?2}
```

- amount > ?1 and firstname != ?2  $\rightarrow$  {'amount': {'\$gt': ?1}, 'firstname': {'\$ne': ?2}}
- lastname like  $?1 \rightarrow \{'lastname': \{'$regex': ?1\}\}$
- lastname is not null → {'lastname':{'\$exists': true}}

PanacheQL refers to the Object parameter name but native queries refer to MongoDB field names.

# **Projection**

Projection can be done for both PanacheQL and native queries.

```
import io.quarkus.mongodb.panache.ProjectionFor;

@ProjectionFor(Person.class) (1)
public class PersonName {
    public String name;
}

PanacheQuery<PersonName> shortQuery = Person.find("status "
, Status.Alive).project(PersonName.class);
```

1 Entity class.

# **DAO pattern**

```
@ApplicationScoped
public class PersonRepository
   implements PanacheMongoRepository<Person> {
}
```

### **Jandex**

If entities are defined in external JAR, you need to enable in these projects the Jandex plugin in project

```
<plugin>
   <groupId>org.jboss.jandex
   <artifactId>jandex-maven-plugin</artifactId>
   <version>1.0.3
   <executions>
       <execution>
           <id>make-index</id>
           <goals>
               <goal>jandex</goal>
           </goals>
       </execution>
   </executions>
   <dependencies>
       <dependency>
           <groupId>org.jboss</groupId>
           <artifactId>jandex</artifactId>
           <version>2.1.1.Final
       </dependency>
   </dependencies>
</plugin>
```

## **Reactive Panache**

MongoDB with Panache allows using reactive implementation too by using ReactivePanacheMongoEntity or ReactivePanacheMongoEntityBase Or ReactivePanacheMongoRepository or ReactivePanacheMongoRepositoryBase depending on your style.

```
public class ReactivePerson extends ReactivePanacheMongoEnt
ity {
    public String name;
}

CompletionStage<Void> cs1 = person.persist();
CompletionStage<List<ReactivePerson>> allPersons = Reactive
Person.listAll();
Publisher<ReactivePerson> allPersons = ReactivePerson.strea
mAll();
```

# **Reactive Programming**

Quarkus implements MicroProfile Reactive spec and uses RXJava2 to provide reactive programming model.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-smallrye-reactive-streams-operators"
```

Asynchronous HTTP endpoint is implemented by returning Java CompletionStage. You can create this class either manually or using MicroProfile Reactive Streams spec:

```
@GET
@Path("/reactive")
@Produces(MediaType.TEXT_PLAIN)
public CompletionStage<String> getHello() {
    return ReactiveStreams.of("h", "e", "l", "o")
    .map(String::toUpperCase)
    .toList()
    .run()
    .thenApply(list -> list.toString());
}
```

Creating streams is also easy, you just need to return Publisher object.

```
@GET
@Path("/stream")
@Produces(MediaType.SERVER_SENT_EVENTS)
public Publisher<String> publishers() {
    return Flowable
        .interval(500, TimeUnit.MILLISECONDS)
        .map(s -> atomicInteger.getAndIncrement())
        .map(i -> Integer.toString(i));
}
```

# **Mutiny and JAX-RS**

Apart from the CompletionStage support, there is also support for Mutiny.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-resteasy-mutiny"
```

```
@GET
@Produces(MediaType.TEXT_PLAIN)
public Uni<String> hello() {
    return Uni.createFrom().item(() -> "hello");
}

@GET
@Produces(MediaType.TEXT_PLAIN)
public Multi<String> multi() {
    return Multi.createFrom().items("hello", "world");
}
```

# **Mutiny**

Quarkus integrates with **Mutiny** as reactive programming library:

```
./mvnw quarkus:add-extension
-Dextensions="mutiny"
```

Converting from/to RxJava2 or Reactor APIs:

RxJava 2

```
<dependency>
    <groupId>io.smallrye.reactive</groupId>
    <artifactId>mutiny-rxjava</artifactId>
</dependency>
```

From RxJava2:

```
Uni<Void> uniFromCompletable = Uni.createFrom()
                                     .converter(UniRxConvert
ers.fromCompletable(), completable);
Uni<String> uniFromSingle = Uni.createFrom()
                                 .converter(UniRxConverters.
fromSingle(), single);
Uni<String> uniFromObservable = Uni.createFrom()
                                 .converter(UniRxConverters.
fromObservable(), observable);
Uni<String> uniFromFlowable = Uni.createFrom()
                                 .converter(UniRxConverters.
fromFlowable(), flowable);
Multi<Void> multiFromCompletable = Multi.createFrom()
                                         .converter(MultiRxC
onverters.fromCompletable(), completable);
Multi<String> multiFromObservable = Multi.createFrom()
                                         .converter(MultiRxC
onverters.fromObservable(), observable);
Multi<String> multiFromFlowable = Multi.createFrom()
                                          .converter(MultiRxC
onverters.fromFlowable(), flowable);
```

### To RxJava2:

```
Completable completable = uni.convert().with(UniRxConverter
s.toCompletable());
Single<Optional<String>> single = uni.convert().with(UniRxC
onverters.toSingle());
Observable < String > observable = uni.convert().with(UniRxCon
verters.toObservable());
Flowable < String > flowable = uni.convert().with(UniRxConvert
ers.toFlowable());
. . .
Completable completable = multi.convert().with(MultiRxConve
rters.toCompletable());
Single<Optional<String>> single = multi.convert().with(Mult
iRxConverters.toSingle());
Observable < String > observable = multi.convert().with(MultiR
xConverters.toObservable());
Flowable<String> flowable = multi.convert().with(MultiRxCon
verters.toFlowable());
```

## Reactor API

```
<dependency>
    <groupId>io.smallrye.reactive</groupId>
     <artifactId>mutiny-reactor</artifactId>
</dependency>
```

#### From Reactor:

```
Uni<String> uniFromMono = Uni.createFrom().converter(UniRea
ctorConverters.fromMono(), mono);
Uni<String> uniFromFlux = Uni.createFrom().converter(UniRea
ctorConverters.fromFlux(), flux);
Multi<String> multiFromMono = Multi.createFrom().converter
(MultiReactorConverters.fromMono(), mono);
Multi<String> multiFromFlux = Multi.createFrom().converter
(MultiReactorConverters.fromFlux(), flux);
```

#### To Reactor:

```
Mono<String> mono = uni.convert().with(UniReactorConverter
s.toMono());
Flux<String> flux = uni.convert().with(UniReactorConverter
s.toFlux());

Mono<String> mono2 = multi.convert().with(MultiReactorConverters.toMono());
Flux<String> flux2 = multi.convert().with(MultiReactorConverters.toFlux());
```

# CompletionStages or Publisher

Multi implements Publisher.

# **Reactive Messaging**

Quarkus relies on MicroProfile Reactive Messaging spec to implement reactive messaging streams.

```
mvn quarkus:add-extension
   -Dextensions="
        io.quarkus:quarkus-smallrye-reactive-messaging"
```

You can just start using in-memory streams by using @Incoming to produce data and @Outgoing to consume data.

Produce every 5 seconds one piece of data.

or in Mutiny:

If you want to dispatch to all subscribers you can annotate the method with @Broadcast.

Consumes generated data from my-in-memory stream.

```
@ApplicationScoped
public class ConsumerData {
    @Incoming("my-in-memory")
    public void randomNumber(int randomNumber) {
        System.out.println("Received " + randomNumber);
    }
}
```

You can also inject an stream as a field:

```
@Inject
@Stream("my-in-memory") Publisher<Integer> randomRumbers;
```

```
@Inject @Stream("generated-price")
Emitter<String> emitter;
```

#### **Patterns**

# $RESTAPI \rightarrow Message$

```
@Inject @Stream("in")
Emitter<String> emitter;
emitter.send(message);
```

# Message → Message

```
@Incoming("in")
@Outgoing("out")
public String process(String in) {
}
```

# $Message \rightarrow SSE$

```
@Inject @Stream("out")
Publisher<String> result;

@GET
@Produces(SERVER_SENT_EVENTS)
public Publisher<String> stream() {
    return result;
}
```

# Message → Business Logic

```
@ApplicationScoped
public class ReceiverMessages {
    @Incoming("prices")
    public void print(String price) {
    }
}
```

Possible implementations are:

# **In-Memory**

If the stream is not configured then it is assumed to be an inmemory stream, if not then stream type is defined by connector field.

### Kafka

To integrate with Kafka you need to add next extensions:

```
mvn quarkus:add-extension
   -Dextensions="
   io.quarkus:quarkus-smallrye-reactive-messaging-kafka"
```

Then @Outgoing, @Incoming or @Stream can be used.

Kafka configuration schema: mp.messaging.[outgoing|incoming].
{stream-name}.cyclue.

The connector type is smallrye-kafka.

```
mp.messaging.outgoing.generated-price.connector=
    smallrye-kafka
mp.messaging.outgoing.generated-price.topic=
    prices
mp.messaging.outgoing.generated-price.bootstrap.servers=
    localhost:9092
mp.messaging.outgoing.generated-price.value.serializer=
    org.apache.kafka.common.serialization.IntegerSerializer

mp.messaging.incoming.prices.connector=
    smallrye-kafka
mp.messaging.incoming.prices.value.deserializer=
    org.apache.kafka.common.serialization.IntegerDeserializer
```

A complete list of supported properties are in Kafka site. For the producer and for consumer

JSON-B Serializer/Deserializer

You can use JSON-B to serialize/deserialize objects.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-kafka-client"
```

To serialize you can use io.quarkus.kafka.client.serialization.JsonbSerializer.

To deserialize you need to extend io.quarkus.kafka.client.serialization.JsonbDeserializer and provide a type.

```
public class BeerDeserializer
  extends JsonbDeserializer<Beer> {
    public BeerDeserializer() {
        super(Beer.class);
    }
}
```

## **AMQP**

To integrate with AMQP you need to add next extensions:

```
./mvnw quarkus:add-extension
-Dextensions="reactive-messaging-amqp"
```

Then <code>@Outgoing</code>, <code>@Incoming</code> or <code>@Stream</code> can be used.

AMQP configuration schema: mp.messaging.[outgoing|incoming]. {stream-name}.cyclue>. Special properties amqp-username and amqp-password are used to configure AMQP broker credentials.

The connector type is smallrye-amqp.

A complete list of supported properties for AMQP.

## **MQTT**

To integrate with MQTT you need to add next extensions:

```
./mvnw quarkus:add-extension
   -Dextensions="vertx, smallrye-reactive-streams-operator
s
   smallrye-reactive-messaging"
```

And add io.smallrye.reactive:smallrye-reactive-messaging-mqtt-1.0:0.0.10 dependency in your build tool.

Then @Outgoing, @Incoming or @Stream can be used.

MQTT configuration schema: mp.messaging.[outgoing|incoming]. {stream-name}.cyclue.

The connector type is smallrye-mqtt.

```
mp.messaging.outgoing.topic-price.type=
    smallrye-mqtt
mp.messaging.outgoing.topic-price.topic=
    prices
mp.messaging.outgoing.topic-price.host=
    localhost
mp.messaging.outgoing.topic-price.port=
    1883
mp.messaging.outgoing.topic-price.auto-generated-client-id=
    true

mp.messaging.incoming.prices.type=
    smallrye-mqtt
mp.messaging.incoming.prices.topic=
    prices
mp.messaging.incoming.prices.host=
    localhost
mp.messaging.incoming.prices.port=
    1883
mp.messaging.incoming.prices.auto-generated-client-id=
    true
```

# **Kafka Streams**

Create streaming queries with the Kafka Streams API.

```
./mvnw quarkus:add-extension
-Dextensions="kafka-streams"
```

All we need to do for that is to declare a CDI producer method which returns the Kafka Streams org.apache.kafka.streams.Topology:

```
@ApplicationScoped
public class TopologyProducer {
    @Produces
    public Topology buildTopology() {
        org.apache.kafka.streams.StreamsBuilder.StreamsBuilder

        builder = new StreamsBuilder();
        // ...
        builder.stream()
        .join()
        // ...
        .toStream()
        .to();
        return builder.build();
    }
}
```

Previous example produces content to another stream. If you want to write interactive queries, you can use Kafka streams.

The Kafka Streams extension is configured via the Quarkus configuration file application.properties.

```
quarkus.kafka-streams.bootstrap-servers=localhost:9092
quarkus.kafka-streams.application-id=temperature-aggregator
quarkus.kafka-streams.application-server=${hostname}:8080
quarkus.kafka-streams.topics=weather-stations,temperature-v
alues

kafka-streams.cache.max.bytes.buffering=10240
kafka-streams.commit.interval.ms=1000
```

**IMPORTANT:** All the properties within the kafka-streams namespace are passed through as-is to the Kafka Streams engine. Changing their values requires a rebuild of the application.

# **Reactive PostgreSQL Client**

You can use Reactive PostgreSQL to execute queries to PostreSQL database in a reactive way, instead of using JDBC way.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-reactive-pg-client"
```

Database configuration is the same as shown in Persistence section, but URL is different as it is not a *jdbc*.

```
quarkus.datasource.db-kind=postgresql
quarkus.datasource.reactive.url=postgresql://your_database
```

Then you can inject io.vertx.mutiny.pgclient.PgPool class.

# **Reactive MySQL Client**

You can use Reactive MySQL to execute queries to MySQL database in a reactive way, instead of using JDBC way.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-reactive-mysql-client"
```

Database configuration is the same as shown in Persistence section, but URL is different as it is not a *jdbc*.

```
quarkus.datasource.db-kind=mysql
quarkus.datasource.reactive.url=mysql://your_database
```

Then you can inject io.vertx.mutiny.mysqlclient.MySQLPool class.

# **ActiveMQ Artemis**

Quarkus uses Reactive Messaging to integrate with messaging systems, but in case you need deeper control when using Apache ActiveMQ Artemis there is also an extension:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-artemis-core"
```

And then you can inject org.apache.activemq.artemis.api.core.client.ServerLocator instance.

```
@ApplicationScoped
public class ArtemisConsumerManager {

    @Inject
    ServerLocator serverLocator;

    private ClientSessionFactory connection;

    @PostConstruct
    public void init() throws Exception {
        connection = serverLocator.createSessionFactory();
    }
}
```

And configure ServerLocator in application.properties:

```
quarkus.artemis.url=tcp://localhost:61616
```

You can configure ActiveMQ Artemis in application.properties file by using next properties prefixed with quarkus:

```
artemis.url
```

Connection URL.

#### artemis.username

Username for authentication.

#### artemis.password

Password for authentication.

#### **Artemis JMS**

If you want to use JMS with Artemis, you can do it by using its extension:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-artemis-jms"
```

And then you can inject javax.jms.ConnectionFactory:

```
@ApplicationScoped
public class ArtemisConsumerManager {

    @Inject
    ConnectionFactory connectionFactory;

    private Connection connection;

    @PostConstruct
    public void init() throws JMSException {
        connection = connectionFactory.createConnection();
        connection.start();
    }
}
```

Configuration options are the same as Artemis core.

# **Vert.X Reactive Clients**

Vert.X Reactive clients in Quarkus, the next clients are supported and you need to add the dependency to use them:

#### **Vert.X Mail Client**

io.smallrye.reactive:smallrye-mutiny-vertx-mail-client

# **Vert.X MongoDB Client**

io.smallrye.reactive:smallrye-mutiny-vertx-mongo-client

### **Vert.X Redis Client**

io.smallrye.reactive:smallrye-mutiny-vertx-redis-client

## **Vert.X Cassandra Client**

io.smallrye.reactive:smallrye-mutiny-vertx-cassandra-client

#### **Vert.X Consul Client**

io.smallrye.reactive:smallrye-mutiny-vertx-consul-client

### **Vert.X Kafka Client**

io.smallrye.reactive:smallrye-mutiny-vertx-kafka-client

# **Vert.X AMQP Client**

io.smallrye.reactive:smallrye-mutiny-vertx-amqp-client

# **Vert.X RabbitMQ Client**

io.smallrye.reactive:smallrye-mutiny-vertx-rabbitmq-client

# Example of Vert.X Web Client:

```
@Inject
Vertx vertx;

private WebClient client;

@PostConstruct
void initialize() {
    this.client = WebClient.create(vertx, ...);
}
```

# RBAC

You can set RBAC using annotations or in application.properties.

#### **Annotations**

You can define roles by using javax.annotation.security.RolesAllowed annotation.

```
@RolesAllowed("Subscriber")
```

You can use io.quarkus.security.Authenticated as a shortcut of @RolesAllowed("\*").

To alter RBAC behaviour there are two configuration properties:

```
quarkus.security.deny-unannotated=true
```

Configuration options:

#### quarkus.jaxrs.deny-uncovered

If true denies by default to all JAX-RS endpoints. (default: false)

#### quarkus.security.deny-unannotated

If true denies by default all CDI methods and JAX-RS endpoints. (default: false)

# File Configuration

Defining RBAC in application.properties instead of using annotations.

```
quarkus.http.auth.policy.role-policy1.roles-allowed=
    user,admin
quarkus.http.auth.permission.roles1.paths=
    /roles-secured/*,/other/*,/api/*
quarkus.http.auth.permission.roles1.policy=
    role-policy1

quarkus.http.auth.permission.permit1.paths=
    /public/*
quarkus.http.auth.permission.permit1.policy=
    permit
quarkus.http.auth.permission.permit1.methods=
    GET

quarkus.http.auth.permission.deny1.paths=
    /forbidden
quarkus.http.auth.permission.deny1.policy=
    deny
```

You need to provide permissions set by using the roles-allowed property or use the built-in ones deny, permit or authenticated.

# **JWT**

Quarkus implements MicroProfile JWT RBAC spec.

```
mvn quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-jwt"
```

Minimum JWT required claims: typ, alg, kid, iss, sub, exp, iat, jti, upn, groups.

You can inject token by using JsonWebToken or a claim individually by using @Claim.

```
@Inject
JsonWebToken jwt;

@Inject
@Claim(standard = Claims.preferred_username)
String name;

@Inject
@Claim("groups")
Set<String> groups;
```

Set of supported types: String, Set<String>, Long, Boolean, `javax.json.JsonValue, Optional, org.eclipse.microprofile.jwt.ClaimValue.

And configuration in src/main/resources/application.properties:

```
mp.jwt.verify.publickey.location=
    META-INF/resources/publicKey.pem
mp.jwt.verify.issuer=
    https://quarkus.io/using-jwt-rbac
```

Configuration options:

### mp.jwt.verify.publickey

Public Key text itself to be supplied as a string.

mp.jwt.verify.publickey.location Relative path or URL of a public key.

### mp.jwt.verify.issuer

iss accepted as valid.

#### smallrye.jwt.token.header

Sets header such as Cookie is used to pass the token. (default: Authorization).

#### smallrye.jwt.token.cookie

Name of the cookie containing a token.

Comma-separated list containing an alternative single or multiple schemes. (default: Bearer).

#### smallrye.jwt.require.named-principal

A token must have a upn or preferred\_username or sub claim set if using <code>java.security.Principal.True</code> makes throw an exception if not set. (default: <code>false</code>).

#### smallrye.jwt.path.sub

Path to the claim with subject name.

#### smallrye.jwt.claims.sub

Default sub claim value.

#### smallrye.jwt.path.groups

Path to the claim containing the groups.

#### smallrye.jwt.groups-separator

Separator for splitting a string which may contain multiple group values. (default. ` `).

#### smallrye.jwt.claims.groups

Default groups claim value.

## smallrye.jwt.jwks.refresh-interval

JWK cache refresh interval in minutes. (default: 60).

#### smallrye.jwt.expiration.grace

Expiration grace in seconds. (default: 60).

### smallrye.jwt.verify.aud

Comma separated list of the audiences that a token aud claim may contain.

## smallrye.jwt.verify.algorithm

Signature algorith. (defsult: RS256)

### smallrye.jwt.token.kid

If set then the verification JWK key as well every JWT token must have a matching kid header.

# smallrye.jwt.time-to-live

The maximum number of seconds that a JWT may be issued for use.

Supported public key formats:

- PKCS#8 PEM
- JWK
- JWKS
- JWK Base64 URL
- JWKS Base64 URL

To send a token to server-side you should use Authorization header: curl -H "Authorization: Bearer eyJraWQiOi...".

To inject claim values, the bean must be <code>@RequestScoped</code> CDI scoped. If you need to inject claim values in scope with a lifetime greater than <code>@RequestScoped</code> then you need to use <code>javax.enterprise.inject.Instance</code> interface.

```
@Inject
@Claim(standard = Claims.iat)
private Instance<Long> providerIAT;
```

## **RBAC**

JWT groups claim is directly mapped to roles to be used in security annotations.

```
@RolesAllowed("Subscriber")
```

#### **Generate tokens**

JWT generation API:

```
Jwt.claims()
    .issuer("https://server.com")
    .claim("customClaim", 3)
    .sign(createKey());
JwtSignatureBuilder jwtSignatureBuilder = Jwt.claims("/test
JsonToken.json").jws();
jwtSignatureBuilder
     .signatureKeyId("some-key-id")
     .signatureAlgorithm(SignatureAlgorithm.ES256)
     .header("custom-header", "custom-value");
     .sign(createKey());
Jwt.claims("/testJsonToken.json")
    .encrypt(createKey());
JwtEncryptionBuilder jwtEncryptionBuilder = Jwt.claims("/te
stJsonToken.json").jwe();
jwtEncryptionBuilder
     .keyEncryptionKeyId("some-key-id")
      .keyEncryptionAlgorithm(KeyEncryptionAlgorithm.ECDH E
S A256KW)
     .header("custom-header", "custom-value");
     .encrypt(createKey());
Jwt.claims("/testJsonToken.json")
  .innerSign(createKey());
  .encrypt(createKey());
```

# **OpenId Connect**

Quarkus can use OpenId Connect or OAuth 2.0 authorization servers such as **Keycloak** to protect resources using bearer token issued by Keycloak server.

```
mvn quarkus:add-extension
-Dextensions="using-openid-connect"
```

You can also protect resources with security annotations.

```
@GET
@RolesAllowed("admin")
```

Configure application to Keycloak service in application.properties file.

```
quarkus.oidc.realm=quarkus
quarkus.oidc.auth-server-url=http://localhost:8180/auth
quarkus.oidc.resource=backend-service
quarkus.oidc.bearer-only=true
quarkus.oidc.credentials.secret=secret
```

Configuration options with quarkus.oidc prefix:

#### enabled

The OIDC is enabled. (default: true)

#### tenant-enabled

If the tenant configuration is enabled. (default: true)

#### application-type

The application type. Possible values: web\_app, service. (default: service)

#### connection-delay

The maximum amount of time the adapter will try connecting.

#### auth-server-url

The base URL of the OpenID Connect (OIDC) server.

## introspection-path

Relative path of the RFC7662 introspection service.

## jwks-path

Relative path of the OIDC service returning a JWK set.

### public-key

Public key for the local JWT token verification

#### client-id

The client-id of the application.

#### roles.role-claim-path

Path to the claim containing an array of groups. (realm/groups)

#### roles.role-claim-separator

Separator for splitting a string which may contain multiple group values.

#### token.issuer

Issuer claim value.

## token.audience

Audience claim value

#### token.expiration-grace

Expiration grace period in seconds.

## token.principal-claim

Name of the claim which contains a principal name.

#### credentials.secret

The client secret

#### authentication.redirect-path

Relative path for calculating a redirect uri query parameter.

#### authentication.restore-path-after-redirect

The original request URI used before the authentication will be restored after the user has been redirected back to the application. (default: true)

#### authentication.scopes

List of scopes.

#### authentication.extra-params

Additional properties which will be added as the query parameters.

#### authentication.cookie-path

Cookie path parameter.

With Keycloak OIDC server https://host:port/auth/realms/{realm} where {realm} has to be replaced by the name of the Keycloak realm.

You can use quarkus.http.cors property to enable consuming form different domain.

# **Multi-tenancy**

Multi-tenancy is supported by adding a sub-category to OIDC configuration properties (ie quarkus.oidc.{tenent\_id}.property).

```
quarkus.oidc.auth-server-url=http://localhost:8180/auth/rea
lms/quarkus
quarkus.oidc.client-id=multi-tenant-client
quarkus.oidc.application-type=web-app

quarkus.oidc.tenant-b.auth-server-url=https://accounts.goog
le.com
quarkus.oidc.tenant-b.application-type=web-app
quarkus.oidc.tenant-b.client-id=xxxx
quarkus.oidc.tenant-b.credentials.secret=yyyy
quarkus.oidc.tenant-b.token.issuer=https://accounts.google.com
quarkus.oidc.tenant-b.authentication.scopes=email,profile,o
penid
```

# OAuth2

Quarkus integrates with OAuth2 to be used in case of opaque tokens (none JWT) and its validation against an introspection endpoint.

```
mvn quarkus:add-extension
-Dextensions="security-oauth2"
```

And configuration in src/main/resources/application.properties:

```
quarkus.oauth2.client-id=client_id
quarkus.oauth2.client-secret=secret
quarkus.oauth2.introspection-url=http://oauth-server/intros
pect
```

And you can map roles to be used in security annotations.

```
@RolesAllowed("Subscriber")
```

Configuration options:

#### quarkus.oauth2.enabled

Determine if the OAuth2 extension is enabled. (default: true)

#### quarkus.oauth2.client-id

The OAuth2 client id used to validate the token.

#### quarkus.oauth2.client-secret

The OAuth2 client secret used to validate the token.

### quarkus.oauth2.introspection-url

URL used to validate the token and gather the authentication claims.

### quarkus.oauth2.role-claim

The claim that is used in the endpoint response to load the roles ((default: scope)

# **Authenticating via HTTP**

HTTP basic auth is enabled by the quarkus.http.auth.basic=true property.

HTTP form auth is enabled by the quarkus.http.auth.form.enabled=true property.

Then you need to add elytron-security-properties-file Or elytron-security-jdbc.

# **Security with Properties File**

You can also protect endpoints and store identities (user, roles) in the file system.

```
mvn quarkus:add-extension
   -Dextensions="elytron-security-properties-file"
```

You need to configure the extension with users and roles files:

And configuration in / 1/2 / 12 L2 L2

```
quarkus.security.users.file.enabled=true
quarkus.security.users.file.users=test-users.properties
quarkus.security.users.file.roles=test-roles.properties
quarkus.security.users.file.auth-mechanism=BASIC
quarkus.security.users.file.realm-name=MyRealm
quarkus.security.users.file.plain-text=true
```

Then users.properties and roles.properties:

```
scott=jb0ss
jdoe=p4ssw0rd
```

```
scott=Admin, admin, Tester, user
jdoe=NoRolesUser
```

**IMPORTANT:** If plain-text is set to false (or omitted) then passwords must be stored in the form MD5 (username: realm: password).

Elytron File Properties configuration properties. Prefix quarkus.security.users is skipped.

#### file.enabled

The file realm is enabled. (default: false)

#### file.auth-mechanism

The authentication mechanism. (default: BASIC)

#### file.realm-name

The authentication realm name. (default: Quarkus)

#### file.plain-text

If passwords are in plain or in MD5. (default: false)

#### file.users

Classpath resource of user/password. (default: users.properties)

#### file.roles

Classpath resource of user/role. (default: roles.properties)

## **Embedded Realm**

You can embed user/password/role in the same application.properties:

```
quarkus.security.users.embedded.enabled=true
quarkus.security.users.embedded.plain-text=true
quarkus.security.users.embedded.users.scott=jb0ss
quarkus.security.users.embedded.roles.scott=admin,tester,us
er
quarkus.security.users.embedded.auth-mechanism=BASIC
```

**IMPORTANT:** If plain-text is set to false (or omitted) then passwords must be stored in the form MD5 (username: realm: password).

Prefix quarkus.security.users.embedded is skipped.

#### file.enabled

The file realm is enabled. (default: false)

#### file.auth-mechanism

The authentication mechanism. (default: BASIC)

# file.realm-name

The authentication realm name. (default: Quarkus)

#### file.plain-text

If passwords are in plain or in MD5. (default: false)

#### file.users.\*

\* is user and value is password.

#### file.roles.\*

\* is user and value is role.

# Security with a JDBC Realm

You can also protect endpoints and store identities in a database.

```
mvn quarkus:add-extension
   -Dextensions="elytron-security-jdbc"
```

You still need to add the database driver (ie jdbc-h2).

You need to configure JDBC and Elytron JDBC Realm:

```
quarkus.datasource.url=
quarkus.datasource.driver=org.h2.Driver
quarkus.datasource.username=sa
quarkus.datasource.password=sa

quarkus.security.jdbc.enabled=true
quarkus.security.jdbc.principal-query.sql=
    SELECT u.password, u.role FROM test_user u WHERE u.user =?
quarkus.security.jdbc.principal-query
    .clear-password-mapper.enabled=true
quarkus.security.jdbc.principal-query
    .clear-password-mapper.password-index=1
quarkus.security.jdbc.principal-query
    .attribute-mappings.0.index=2
quarkus.security.jdbc.principal-query
    .attribute-mappings.0.to=groups
```

You need to set the index (1-based) of password and role.

Elytron JDBC Realm configuration properties. Prefix quarkus.security.jdbc is skipped.

#### auth-mechanism

The authentication mechanism. (default: BASIC)

#### realm-name

The authentication realm name. (default: Quarkus)

#### enabled

If the properties store is enabled. (default: false)

### principal-query.sql

The sql query to find the password.

#### principal-query.datasource

The data source to use.

#### principal-query.clear-password-mapper.enabled

If the clear-password-mapper is enabled. (default: false)

#### principal-query.clear-password-mapper.password-index

The index of column containing clear password. (default: 1)

#### principal-query.bcrypt-password-mapper.enabled

If the bcrypt-password-mapper is enabled. (default: false)

#### principal-query.bcrypt-password-mapper.password-index

The index of column containing password hash. (default: 0)

#### principal-query.bcrypt-password-mapper.hash-encoding

A string referencing the password hash encoding (BASE64 or HEX). (default: BASE64)

#### principal-query.bcrypt-password-mapper.salt-index

The index column containing the Bcrypt salt. (default: 0)

# principal-query.bcrypt-password-mapper.salt-encoding

A string referencing the salt encoding (BASE 64 Or HEX). (default: BASE 64)

#### principal-query.bcrypt-password-mapper.iteration-count-index

The index column containing the Bcrypt iteration count. (default: 0)

For multiple datasources you can use the datasource name in the properties:

```
quarkus.datasource.url=
quarkus.security.jdbc.principal-query.sql=
quarkus.datasource.permissions.url=
quarkus.security.jdbc.principal-query.permissions.sql=
```

# Security with JPA

You can also protect endpoints and store identities in a database using JPA.

```
mvn quarkus:add-extension
-Dextensions="security-jpa"
```

```
@io.quarkus.security.jpa.UserDefinition
@Table(name = "test user")
@Entity
public class User extends PanacheEntity {
    @io.quarkus.security.Username
    public String name;
    @io.quarkus.security.Password
    public String pass;
    @ManyToMany
    @Roles
    public List<Role> roles = new ArrayList<>();
     public static void add(String username, String passwor
d) {
        User user = new User();
        user.username = username;
        user.password = BcryptUtil.bcryptHash(password);
        user.persist();
@Entity
public class Role extends PanacheEntity
    @ManyToMany(mappedBy = "roles")
    public List<ExternalRolesUserEntity> users;
    @io.quarkus.security.RolesValue
    public String role;
```

You need to configure JDBC:

```
quarkus.datasource.url=jdbc:postgresql:security_jpa
quarkus.datasource.driver=org.postgresql.Driver
quarkus.datasource.username=quarkus
quarkus.datasource.password=quarkus
quarkus.hibernate-orm.database.generation=drop-and-create
```

# Vault

Quarkus integrates with Vault to manage secrets or protecting sensitive data.

```
mvn quarkus:add-extension
-Dextensions="vault"
```

And configuring Vault in application.properties:

```
# vault url
quarkus.vault.url=http://localhost:8200

quarkus.vault.authentication.userpass.username=
    bob
quarkus.vault.authentication.userpass.password=
    sinclair

# path within the kv secret engine
quarkus.vault.secret-config-kv-path=
    myapps/vault-quickstart/config
quarkus.vault.secret-config-kv-path.singer=
    multi/singer
```

vault kv put secret/myapps/vault-quickstart/config a-privatekey=123456

vault kv put secret/multi/singer firstname=paul

```
@ConfigProperty(name = "a-private-key")
String privateKey;

@ConfigProperty(name = "singer.firstname")
String firstName;
```

You can access the KV engine programmatically:

```
@Inject
VaultKVSecretEngine kvSecretEngine;

kvSecretEngine.readSecret("myapps/vault-quickstart/" + vaul
tPath).toString();

Map<String, String> secrets;
kvSecretEngine.writeSecret("myapps/vault-quickstart/crud",
    secrets);

kvSecretEngine.deleteSecret("myapps/vault-quickstart/crud");
```

# **Fetching credentials DB**

With the next kv vault kv put secret/myapps/vault-quickstart/db password=connor

```
quarkus.vault.credentials-provider.mydatabase.kv-path=
    myapps/vault-quickstart/db
quarkus.datasource.credentials-provider=
    mydatabase

quarkus.datasource.url=
    jdbc:postgresql://localhost:5432/mydatabase
quarkus.datasource.driver=
    org.postgresql.Driver
quarkus.datasource.username=
    sarah
```

No password is set as it is fetched from Vault.

INFO: dynamic database credentials through the database-credentials-role property.

### **Transit**

```
@Inject
VaultTransitSecretEngine transit;

transit.encrypt("my_encryption", text);
transit.decrypt("my_encryption", text).asString();
transit.sign("my-sign-key", text);
```

Elytron JDBC Realm configuration properties. Prefix quarkus.vault is skipped.

url

Vault server URL

authentication.client-token
Vault token to access

authentication.app-role.role-id
Role Id for AppRole auth

authentication.app-role.secret-id

Secret Id for AppRole auth

authentication.userpass.username Username for userpass auth

authentication.userpass.password

Password for userpass auth

authentication.kubernetes.role

Kubernetes authentication role

authentication.kubernetes.jwt-token-path

Location of the file containing the Kubernetes JWT token

renew-grace-period

Renew grace period duration (default: 1H)

secret-config-cache-period

Vault config source cache period (default: 10M)

secret-config-kv-path

Vault path in kv store. List of paths is supported in CSV

log-confidentiality-level

Used to hide confidential infos. low, medium, high (default: medium)

kv-secret-engine-version

Kv secret engine version (default: 1)

Im seemst ansing mount noth Ky secret engine noth (default: accest)

```
tls.skip-verify
```

Allows to bypass certificate validation on TLS communications (default: false)

#### tls.ca-cert

Certificate bundle used to validate TLS communications

#### tls.use-kubernetes-ca-cert

TLS will be active (default: true)

#### connect-timeout

Tiemout to establish a connection (default: 5s)

#### read-timeout

Request timeout (default: 1s)

# credentials-provider."credentials-provider".database-credentialsrole

Database credentials role

#### 

A path in vault kv store, where we will find the kv-key

### credentials-provider."credentials-provider".kv-key

Key name to search in vault path kv-path (default: password)

# **JAX-RS**

Quarkus uses JAX-RS to define REST-ful web APIs. Under the covers, Rest-EASY is working with Vert.X directly without using any Servlet.

It is **important** to know that if you want to use any feature that implies a <code>servlet</code> (ie Servlet Filters) then you need to add the <code>quarkus-undertow</code> extension to switch back to the <code>servlet</code> ecosystem but generally speaking, you don't need to add it as everything else is well-supported.

```
@Path("/book")
public class BookResource {

    @GET
    @Produces(MediaType.APPLICATION_JSON)
    public List<Book> getAllBooks() {}

    @POST
    @Produces(MediaType.APPLICATION_JSON)
    public Response createBook(Book book) {}

    @DELETE
    @Path("{isbn}")
    @Produces(MediaType.APPLICATION_JSON)
    public Response deleteBook(
        @PathParam("isbn") String isbn) {}

    @GET
    @Produces(MediaType.APPLICATION_JSON)
    @Path("search")
    public Response searchBook(
        @QueryParam("description") String description) {}
}
```

To get information from request:

### @PathParam

Gets content from request URI. (example: /book/{id}@PathParam("id"))

#### @QueryParam

Gets query parameter. (example: /book?desc=""
@QueryParam("desc))

#### @FormParam

Gets form parameter.

#### @MatrixParam

Get URI matrix parameter. (example: /book;author=mkyong;country=malaysia)

#### @CookieParam

Gets cookie param by name.

## @HeaderParam

Gets header parameter by name.

Valid HTTP method annotations provided by the spec are: @GET, @POST, @PUT, @DELETE, @PATCH, @HEAD and @OPTIONS.

You can create new annotations that bind to HTTP methods not defined by the spec.

```
@Target({ElementType.METHOD})
@Retention(RetentionPolicy.RUNTIME)
@HttpMethod("LOCK")
public @interface LOCK {
}

@LOCK
public void lockIt() {}
}
```

# Injecting

Using @Context annotation to inject JAX-RS and Servlet information.

```
@GET
public String getBase(@Context UriInfo uriInfo) {
   return uriInfo.getBaseUri();
}
```

Possible injectable objects: SecurityContext, Request, Application, Configuration, Providers, ResourceContext, ServletConfig, ServletContext, HttpServletRequest, HttpServletResponse, HttpHeaders, Urinfo, SseEventSink and Sse.

### **HTTP Filters**

HTTP request and response can be intercepted to manipulate the metadata (ie headers, parameters, media type, ...) or abort a request. You only need to implement the next ContainerRequestFilter and ContainerResponseFilter JAX-RS interfaces respectively.

# **Exception Mapper**

You can map exceptions to produce a custom output by implementing ExceptionMapper interface:

# Caching

Annotations to set Cache-Control headers:

```
@Produces (MediaType.APPLICATION_JSON)
@org.jboss.resteasy.annotations.cache.NoCache
public User me() {}

@Produces (MediaType.APPLICATION_JSON)
@org.jboss.resteasy.annotations.cache.Cache(
    maxAge = 2000,
    noStore = false
)
public User you() {}
```

# **Vert.X Filters and Routes**

## **Programmatically**

You can also register Vert.X Filters and Router programmatically inside a CDI bean:

```
import io.quarkus.vertx.http.runtime.filters.Filters;
import io.vertx.ext.web.Router;
import javax.enterprise.context.ApplicationScoped;
import javax.enterprise.event.Observes;
@ApplicationScoped
public class MyBean
    public void filters(
            @Observes Filters filters) {
        filters
            .register(
                rc -> {
                    rc.response()
                        .putHeader("X-Filter", "filter 1");
                    rc.next();
                },
                10);
    public void routes (
            @Observes Router router) {
        router
            .get("/")
            .handler(rc -> rc.response().end("OK"));
```

#### **Declarative**

You can use <code>@Route</code> annotation to use reactive routes and <code>@RouteFilter</code> to sue reactive filters in a declarative way:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-vertx-web"
```

```
@ApplicationScoped
public class MyDeclarativeRoutes {

    @Route(path = "/hello", methods = HttpMethod.GET)
    public void greetings(RoutingContext rc) {

        String name = rc.request().getParam("name");

        if (name == null) {

            name = "world";

        }

        rc.response().end("hello " + name);
}

    @RouteFilter(20)
    void filter(RoutingContext rc) {

        rc.response().putHeader("X-Filter", "filter 2");

        rc.next();
}
```

# **Vert.X Verticle**

Vert.X Verticles are also supported:

Verticles can be:

#### bare

extending io.vertx.core.AbstractVerticle. mutiny: extendig io.smallrye.mutiny.vertx.core.AbstractVerticle.

# **GZip Support**

You can configure Quarkus to use GZip in the application.properties file using the next properties with quarkus.resteasy suffix:

```
gzip.enabled
```

EnableGZip. (default: false)

# gzip.max-input

Configure the upper limit on deflated request body. (default: 10M)

# **CORS Filter**

Quarkus comes with a CORS filter that can be enabled via configuration:

```
quarkus.http.cors=true
```

Prefix is quarkus.http.

#### cor

Enable CORS. (default: false)

#### cors.origins

CSV of origins allowed. (dedault: Any request valid.)

#### ors methods

CSV of methods valid. (default: Any method valid.)

#### cors.headers

CSV of valid allowed headers. (default: Any requested header valid.)

#### cors.exposed-headers

CSV of valid exposed headers.

# **Fault Tolerance**

Quarkus uses MicroProfile Fault Tolerance spec:

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-fault-tolerance"
```

MicroProfile Fault Tolerance spec uses CDI interceptor and it can be used in several elements such as CDI bean, JAX-RS resource or MicroProfile Rest Client.

To do automatic retries on a method:

```
@Path("/api")
@RegisterRestClient
public interface WorldClockService {
    @GET @Path("/json/cet/now")
    @Produces(MediaType.APPLICATION_JSON)
    @Retry(maxRetries = 2)
    WorldClock getNow();
}
```

You can set fallback code in case of an error by using <code>@Fallback</code> annotation:

```
@Retry(maxRetries = 1)
@Fallback(fallbackMethod = "fallbackMethod")
WorldClock getNow() {}

public WorldClock fallbackMethod() {
    return new WorldClock();
}
```

fallbackMethod must have the same parameters and return type as the annotated method.

You can also set logic into a class that implements FallbackHandler interface:

And set it in the annotation as value

In case you want to use circuit breaker pattern:

If 3  $_{(4 \times 0.75)}$  failures occur among the rolling window of 4 consecutive invocations then the circuit is opened for 1000 ms and then be back to half open. If the invocation succeeds then the circuit is back to closed again.

You can use **bulkahead** pattern to limit the number of concurrent access to the same resource. If the operation is synchronous it uses a semaphore approach, if it is asynchronous a thread-pool one. When a request cannot be processed BulkheadException is thrown. It can be used together with any other fault tolerance annotation.

Fault tolerance annotations:

# **Annotation Properties** @Timeout unit maxRetries, delay, delayUnit, maxDuration, durationUnit, @Retry jitter, jitterDelayUnit, retryOn, abort.On @Fallback fallbackMethod waitingTaskQueue (only valid in @Bulkhead asynchronous) failOn, delayUnit, delay, @CircuitBreaker requestVolumeThreshold, failureRatio, successThreshold

@Asynchronous

You can override annotation parameters via configuration file using property [classname/methodname/]annotation/parameter:

```
org.acme.quickstart.WorldClock/getNow/Retry/maxDuration=30
# Class scope
org.acme.quickstart.WorldClock/Retry/maxDuration=3000
# Global
Retry/maxDuration=3000
```

You can also enable/disable policies using special parameter enabled.

```
org.acme.quickstart.WorldClock/getNow/Retry/enabled=false
# Disable everything except fallback
MP_Fault_Tolerance_NonFallback_Enabled=false
```

MicroProfile Fault Tolerance integrates with MicroProfile Metrics spec. You can disable it by setting MP Fault Tolerance Metrics Enabled to false.

# **Observability**

## **Health Checks**

Quarkus relies on MicroProfile Health spec to provide health checks.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-health"
```

By just adding this extension, an endpoint is registered to /health providing a default health check.

```
{
    "status": "UP",
    "checks": [
    ]
}
```

To create a custom health check you need to implement the HealthCheck interface and annotate either with @Readiness (ready to process requests) or @Liveness (is running) annotations.

Builds the next output:

Since health checks are CDI beans, you can do:

You can ping liveness or readiness health checks individually by querying /health/live Or /health/ready.

Quarkus comes with some HealthCheck implementations for checking service status.

- SocketHealthCheck: checks if host is reachable using a socket.
- **UrlHealthCheck**: checks if host is reachable using a Http URL connection.
- InetAddressHealthCheck: checks if host is reachable using InetAddress.isReachable method.

If you want to override or set manually readiness/liveness probes, you can do it by setting health properties:

```
quarkus.smallrye-health.root-path=/hello
quarkus.smallrye-health.liveness-path=/customlive
quarkus.smallrye-health.readiness-path=/customready
```

# **Automatic readiness probes**

Some default *readiness probes* are provided by default if any of the next features are added:

#### datasource

A probe to check database connection status.

### kafka

A probe to check kafka connection status. In this case you need to enable manually by setting quarkus.kafka.health.enabled to true.

## mongoDB

A probe to check MongoDB connection status.

#### neo4i

A probe to check Neo4J connection status.

#### artemis

A probe to check Artemis JMS connection status.

#### kafka-streams

Liveness (for stream state) and Readiness (topics created) probes.

You can disable the automatic generation by setting <component>.health.enabled to false.

```
quarkus.kafka-streams.health.enabled=false
quarkus.mongodb.health.enabled=false
quarkus.neo4j.health.enabled=false
```

### **Metrics**

Quarkus can utilize the MicroProfile Metrics spec to provide metrics support.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-metrics"
```

The metrics can be read with JSON or the OpenMetrics format. An endpoint is registered automatically at /metrics providing default metrics.

MicroProfile Metrics annotations:

#### @Timed

Tracks the duration.

#### @Metered

Tracks the frequency of invocations.

#### @Counted

Counts number of invocations.

#### Gauge

Samples the value of the annotated object.

### @ConcurrentGauge

Gauge to count parallel invocations.

#### @Metric

Used to inject a metric. Valid types Meter, Timer, Counter, Histogram. Gauge only on producer methods/fields.

@Gauge annotation returning a measure as a gauge.

```
@Gauge(name = "hottestSauce", unit = MetricUnits.NONE,
description = "Hottest Sauce so far.")
public Long hottestSauce() {}
```

Injecting a histogram using @Metric.

```
@Inject
@Metric(name = "histogram")
Histogram historgram;
```

You can configure Metrics:

```
quarkus.smallrye-metrics.path=/mymetrics
```

Prefix is quarkus.smallrye-metrics.

## path

The path to the metrics handler. (default: /metrics)

#### extensions.enabled

Metrics are enabled or not. (default: true)

#### micrometer.compatibility

Apply Micrometer compatibility mode. (default: false)

quarkus.hibernate-orm.metrics.enabled **set to** true **exposes Hibernate metrics under** vendor **scope**.

quarkus.mongodb.metrics.enabled set to true exposes MongoDB metrics under vendor scope.

You can apply metrics annotations via CDI stereotypes:

# **Tracing**

Quarkus can utilize the MicroProfile OpenTracing spec.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-opentracing"
```

Requests sent to any endpoint are traced automatically.

This extension includes OpenTracing support and Jaeger tracer.

Jaeger tracer configuration:

```
quarkus.jaeger.service-name=myservice
quarkus.jaeger.sampler-type=const
quarkus.jaeger.sampler-param=1
quarkus.jaeger.endpoint=http://localhost:14268/api/traces
```

@Traced annotation can be set to disable tracing at class or method level.

Tracer class can be injected into the class.

```
@Inject
Tracer tracer;

tracer.activeSpan().setBaggageItem("key", "value");
```

You can disable Jaeger extension by using quarkus.jaeger.enabled property.

You can log the traceId, spanId and sampled in normal log:

### **Additional tracers**

# **JDBC Tracer**

Adds a span for each JDBC queries.

```
<dependency>
    <groupId>io.opentracing.contrib</groupId>
    <artifactId>opentracing-jdbc</artifactId>
</dependency>
```

Configure JDBC driver apart from tracing properties seen before:

```
# add ':tracing' to your database URL
quarkus.datasource.url=
    jdbc:tracing:postgresql://localhost:5432/mydatabase
quarkus.datasource.driver=
    io.opentracing.contrib.jdbc.TracingDriver
quarkus.hibernate-orm.dialect=
    org.hibernate.dialect.PostgreSQLDialect
```

# **AWS XRay**

If you are building native images, and want to use AWS X-Ray Tracing with your lambda you will need to include quarkus-amazon-lambda-xray as a dependency in your pom.

# Native Executable

You can build a native image by using GraalVM. The common use case is creating a Docker image so you can execute the next commands:

You can use quarkus.native.container-runtime to select the container runtime to use. Now docker (default) and podman are the valid options.

```
./mvnw package -Pnative -Dquarkus.native.container-runtime= podman
```

To configure native application, you can create a config directory at the same place as the native file and place an application.properties file inside. config/application.properties.

#### SSL

To create a native image with SSL you need to copy SunEC library and certificates:

## Java 8:

```
FROM quay.io/quarkus/ubi-quarkus-native-image:{graalvm-vers ion}-java8 as nativebuilder

RUN mkdir -p /tmp/ssl-libs/lib \
    && cp /opt/graalvm/jre/lib/security/cacerts /tmp/ssl-libs \
    && cp /opt/graalvm/jre/lib/amd64/libsunec.so /tmp/ssl-lib s/lib/

FROM registry.access.redhat.com/ubi8/ubi-minimal
WORKDIR /work/
COPY --from=nativebuilder /tmp/ssl-libs/ /work/
COPY target/*-runner /work/application

RUN chmod 775 /work /work/application

EXPOSE 8080
CMD ["./application", "-Dquarkus.http.host=0.0.0.0", "-Djava.library.path=/work/lib", "-Djavax.net.ssl.trustStore=/work/cacerts"]
```

#### Java 11:

```
FROM quay.io/quarkus/ubi-quarkus-native-image:{graalvm-vers
ion}-javal1 as nativebuilder
RUN mkdir -p /tmp/ssl-libs/lib \
    && cp /opt/graalvm/lib/security/cacerts /tmp/ssl-libs \
    && cp /opt/graalvm/lib/libsunec.so /tmp/ssl-libs/lib/

FROM registry.access.redhat.com/ubi8/ubi-minimal
WORKDIR /work/
COPY --from=nativebuilder /tmp/ssl-libs/ /work/
COPY target/*-runner /work/application
RUN chmod 775 /work /work/application
EXPOSE 8080
CMD ["./application", "-Dquarkus.http.host=0.0.0.0", "-Djava.library.path=/work/lib", "-Djavax.net.ssl.trustStore=/work/cacerts"]
```

# **Container Images Creation**

You can levarage to Quarkus to generation and release of Docker containers. It provides several extensions to make it so.

Prefix is quarkus.container-image:

#### group

The group/repository of the image. (default: the \${user.name})

#### name

The name of the image. (default: the application name)

# tag

The tag of the image. (default: the application version)

## registry

The registry to use for pushing. (default: docker.io)

#### username

The registry username.

#### password

The registry password.

#### insecure

Flag to allow insecure registries. (default: false)

#### build

Boolean to set if image should be built. (default: false)

#### push

Boolean to set if image should be pushed. (default: false)

Jib

```
./mvnw quarkus:add-extensions
-Dextensions="quarkus-container-image-jib"
```

Prefix is quarkus.container-image-jib:

#### base-jvm-image

The base image to use for the jib build. (default: fabric8/java-alpine-openjdk8-jre)

#### base-native-image

The base image to use for the native build. (default: registry.access.redhat.com/ubi8/ubi-minimal)

### jvm-arguments

```
The arguments to pass to java. (default: Dquarkus.http.host=0.0.0.0,-Djava.util.logging.manager=org.jboss.logmanager.LogManager)
```

#### native-arguments

The arguments to pass to the native application. (default: - Dquarkus.http.host=0.0.0.0)

#### environment-variables

Map of environment variables.

#### Docker

```
./mvnw quarkus:add-extensions
-Dextensions="quarkus-container-image-docker"
```

Prefix is quarkus.container-image-s2i:

## dockerfile-jvm-path

```
Path to the JVM Dockerfile. (default: ${project.root}/src/main/docker/Dockerfile.jvm)
```

## dockerfile-native-path

```
Path to the native Dockerfile. (default: ${project.root}/src/main/docker/Dockerfile.native)
```

#### S<sub>2</sub>I

```
./mvnw quarkus:add-extensions
-Dextensions="quarkus-container-image-s2i"
```

Prefix is quarkus.container-image-docker:

# base-jvm-image

The base image to use for the s2i build. (default: fabric8/java-alpine-openjdk8-jre)

# base-native-image

The base image to use for the native build. (default: registry.access.redhat.com/ubi8/ubi-minimal)

# **Kubernetes**

Quarks can use Dekorate to generate Kubernetes resources.

```
./mvnw quarkus:add-extensions
-Dextensions="quarkus-kubernetes"
```

Running ./mvnw package the Kubernetes resources are created at target/kubernetes/ directory.

Container Images Creation integrates with Kubernetes extension, so no need of extra Kubernetes properties.

Generated resource is integrated with MicroProfile Health annotations.

Also, you can customize the generated resource by setting the new values in application.properties:

```
quarkus.kubernetes.labelsfoo=bar
quarkus.kubernetes.readiness-probe.period-seconds=45
quarkus.kubernetes.mounts.github-token.path=/deployment/github
quarkus.kubernetes.mounts.github-token.read-only=true
quarkus.kubernetes.secret-volumes.github-token.volume-name=
github-token
quarkus.kubernetes.secret-volumes.github-token.secret-name=
greeting-security
quarkus.kubernetes.secret-volumes.github-token.default-mode=420
quarkus.kubernetes.config-map-volumes.github-token.config-map-name=my-secret
quarkus.kubernetes.expose=true
```

All possible values are explained at https://quarkus.io/guides/kubernetes#configuration-options.

### **Labels and Annotations**

The generated manifest use the Kubernetes recommended labels and annotations.

```
"labels" : {
    "app.kubernetes.io/part-of" : "todo-app",
    "app.kubernetes.io/name" : "todo-rest",
    "app.kubernetes.io/version" : "1.0-rc.1"
}

"annotations": {
    "app.quarkus.io/vcs-url" : "<some url>",
    "app.quarkus.io/commit-id" : "<some git SHA>",
}
```

You can override the labels by using the next properties:

```
quarkus.kubernetes.part-of=todo-app
quarkus.kubernetes.name=todo-rest
quarkus.kubernetes.version=1.0-rc.1
```

Or add new labels and/or annotations:

```
quarkus.kubernetes.labels.foo=bar
quarkus.kubernetes.annotations.foo=bar
```

# **Kubernetes Deployment Targets**

You can generate different resources setting the property quarkus.kubernetes.deployment-target.

Possible values are kubernetes, openshift and knative. The default value is kubernetes.

List of configuration options:

# **kubernetes**

https://quarkus.io/guides/kubernetes#configuration-options

# openshift

https://quarkus.io/guides/kubernetes#openshift

#### **Knative**

https://quarkus.io/guides/kubernetes#knative

#### **Deployment**

To deploy automatically the generated resources, you need to set quarkus.container.deploy flag to true.

```
mvn clean package -Dquarkus.kubernetes.deploy=true
```

If you set this flag to true, the build and push flags from container-image are set to true too.

To deploy the application, the extension uses the 'https://github.com/fabric8io/kubernetes-client. All options described at Kubernetes Client are valid here.

# **OpenShift**

Instead of adding Kubernetes extension, set container image s2i and the target to openshift for working with OpenShift, an extension grouping all of the is created:

```
./mvnw quarkus:add-extension
-Dextensions="openshift"
```

# **Kubernetes Client**

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-kubernetes-client"
```

List of Kubernetes client parameters.

quarkus.kubernetes-client as prefix is skipped in the next table.

#### trust-certs

Trust self-signed certificates. (default: false)

#### master-url

URL of Kubernetes API server.

#### namesapce

Default namespace.

#### ca-cert-file

CA certificate data.

#### client-cert-file

Client certificate file.

#### client-cert-data

Client certificate data

#### client-key-data

Client key data.

## client-key-algorithm

Client key algorithm.

#### client-key-passphrase

Client key passphrase.

#### username

Username.

#### password

Password.

#### watch-reconnect-interval

Watch reconnect interval. (default: PT1s)

# watch-reconnect-limit

Maximum reconnect attempts. (default: -1)

### connection-timeout

Maximum amount of time to wait for a connection. (default: PT10S)

#### request-timeout

Maximum amount of time to wait for a request. (default: PT10S)

### rolling-timeout

Maximum amount of time to wait for a rollout. (default: PT15M)

HTTP proxy used to access the Kubernetes.

#### https-proxy

HTTPS proxy used to access the Kubernetes.

#### proxy-username

Proxy username.

#### proxy-password

Proxy password

#### no-proxy

IP addresses or hosts to exclude from proxying

Or programmatically:

# And inject it on code:

# **Testing**

Quarkus provides a Kubernetes Mock test resource that starts a mock of Kubernetes API server and sets the proper environment variables needed by Kubernetes Client.

Register next dependency: io.quarkus:quarkus-test-kubernetes-client:test.

```
@QuarkusTestResource(KubernetesMockServerTestResource.clas
s)
@QuarkusTest
public class KubernetesClientTest
    @MockServer
    private KubernetesMockServer mockServer;
    public void test() {
        final Pod pod1 = ...
        mockServer
            .expect()
            .get()
            .withPath("/api/v1/namespaces/test/pods")
            .andReturn(200,
                new PodListBuilder()
                .withNewMetadata()
                .withResourceVersion("1")
                .endMetadata()
                .withItems(pod1, pod2)
                .build())
            .always();
```

# **Amazon Lambda**

Quarkus integrates with Amazon Lambda.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-amazon-lambda"
```

And then implement com.amazonaws.services.lambda.runtime.RequestHandler interface.

You can set the handler name by using quarkus.lambda.handler property or by annotating the Lambda with the CDI @Named annotation.

#### **Test**

You can write tests for Amazon lambdas:

```
<dependency>
  <groupId>io.quarkus</groupId>
  <artifactId>quarkus-test-amazon-lambda</artifactId>
    <scope>test</scope>
</dependency>
```

```
@Test
public void testLambda() {
    MyInput in = new MyInput();
    in.setGreeting("Hello");
    in.setName("Stu");
    MyOutput out = LambdaClient.invoke(MyOutput.class, in);
}
```

To scaffold a AWS Lambda run:

```
mvn archetype:generate \
    -DarchetypeGroupId=io.quarkus \
    -DarchetypeArtifactId=quarkus-amazon-lambda-archetype \
    -DarchetypeVersion={version}
```

# **Azure Functions**

Quarkus can make a microservice be deployable to the Azure Functions.

To scaffold a deployable microservice to the Azure Functions run:

```
mvn archetype:generate \
   -DarchetypeGroupId=io.quarkus \
   -DarchetypeArtifactId=quarkus-azure-functions-http-archet
ype \
   -DarchetypeVersion={version}
```

# **Apache Camel**

Apache Camel Quarkus has its own site: https://github.com/apache/camel-quarkus

# WebSockets

Quarkus can be used to handling web sockets.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-undertow-websockets"
```

And web sockets classes can be used:

# OpenAPI

Quarkus can expose its API description as OpenAPI spec and test it using Swagger UI.

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-smallrye-openapi"
```

Then you only need to access to /openapi to get OpenAPI v3 spec of services.

You can update the OpenApi path by setting quarkus.smallrye-openapi.path property.

Also, in case of starting Quarkus application in dev or test mode, Swagger UI is accessible at /swagger-ui. If you want to use it in production mode you need to set quarkus.swagger-ui.always-include property to true.

You can update the Swagger UI path by setting quarkus.swagger-ui.path property.

```
quarkus.swagger-ui.path=/my-custom-path
```

You can customize the output by using Open API v3 annotations.

All possible annotations can be seen at org.eclipse.microprofile.openapi.annotations package.

You can also serve OpenAPI Schema from static files instead of dynamically generated from annotation scanning.

You need to put OpenAPIdocumentation under META-INF directory (ie: META-INF/openapi.yaml).

A request to <code>/openapi</code> will serve the combined OpenAPI document from the static file and the generated from annotations. You can disable the scanning documents by adding the next configuration <code>property: mp.openapi.scan.disable=true</code>.

Other valid document paths are: META-INF/openapi.yml, META-INF/openapi.json, WEB-INF/classes/META-INF/openapi.yml, WEB-INF/classes/META-INF/openapi.yaml, WEB-INF/classes/META-INF/openapi.json.

# Mail Sender

You can send emails by using Quarkus Mailer extension:

```
./mvnw quarkus:add-extension
-Dextensions="io.quarkus:quarkus-mailer"
```

You can inject two possible classes io.quarkus.mailer.Mailer for synchronous API or io.quarkus.mailer.reactive.ReactiveMailer for asynchronous/reactive API.

```
@Inject
Mailer mailer;
```

And then you can use them to send an email:

```
mailer.send(
    Mail.withText("to@acme.org", "Subject", "Body")
);
```

# **Reactive Mail client**

```
@Inject
ReactiveMailer reactiveMailer;

CompletionStage<Response> stage =
   reactiveMailer.send(
        Mail.withText("to@acme.org", "Subject", "Body")
   )
   .subscribeAsCompletionStage()
   .thenApply(x -> Response.accepted().build());
```

If you are using quarkus-resteasy-mutiny, you can return io.smallrye.mutiny.Uni type.

Mail class contains methods to add cc, bcc, headers, bounce address, reply to, attachments, inline attachments and html body.

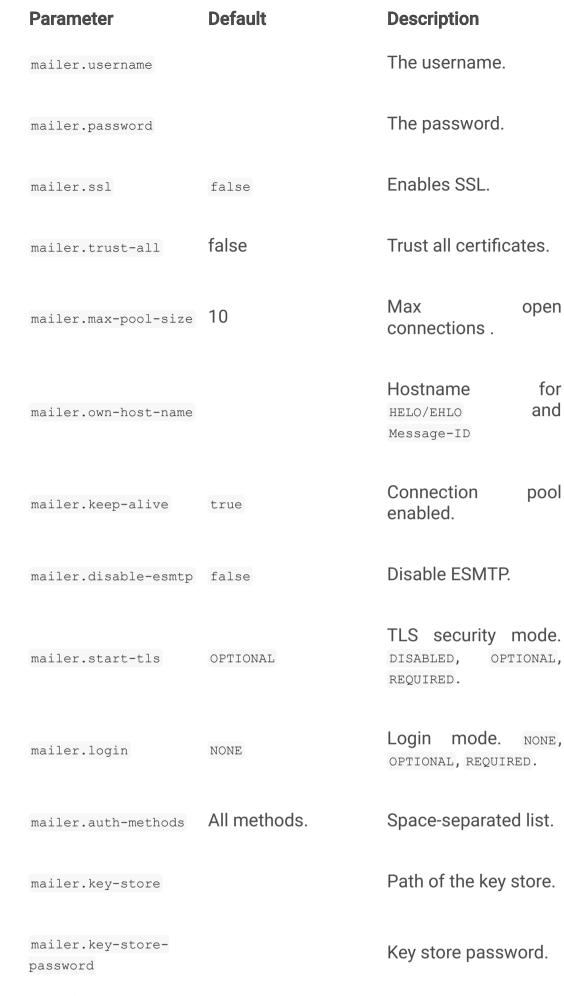

If you need deep control you can inject Vert.x mail client @Inject MailClient client;

You need to configure SMTP properties to be able to send an email:

```
quarkus.mailer.from=test@quarkus.io
quarkus.mailer.host=smtp.sendgrid.net
quarkus.mailer.port=465
quarkus.mailer.ssl=true
quarkus.mailer.username=....
quarkus.mailer.password=....
```

List of Mailer parameters. quarkus. as a prefix is skipped in the next table.

Parameter	Default	Description
mailer.from		Default address.
mailer.mock	false in prod, true in dev and test.	Emails not sent, just printed and stored in a MockMailbox.
mailer.bounce- address		Default address.
mailer.host	mandatory	SMTP host.
mailer.port	25	SMTP port.

if you enable SSL for the mailer and you want to build a native executable, you will need to enable the SSL support quarkus.ssl.native=true.

## **Testing**

If quarkus.mailer.mock is set to true, which is the default value in dev and test mode, you can inject MockMailbox to get the sent messages.

# **Scheduled Tasks**

You can schedule periodic tasks with Quarkus.

```
@ApplicationScoped
public class CounterBean {

    @Scheduled(every="10s")
    void increment() {}

    @Scheduled(cron="0 15 10 * * ?")
    void morningTask() {}
}
```

every and cron parameters can be surrounded with {} and the value is used as config property to get the value.

```
@Scheduled(cron = "{morning.check.cron.expr}")
void morningTask() {}
```

And configure the property into application.properties:

```
morning.check.cron.expr=0 15 10 * * ?
```

By default Quarkus expresion is used, but you can change that by setting quarkus.scheduler.cron-type property.

```
quarkus.scheduler.cron-type=unix
```

org.quartz.Scheduler can be injected as any other bean and scendule jobs programmatically.

```
@Inject
org.quartz.Scheduler quartz;
quartz.scheduleJob(job, trigger);
```

# **Kogito**

Quarkus integrates with Kogito, a next-generation business automation toolkit from Drools and jBPM projects for adding business automation capabilities.

To start using it you only need to add the next extension:

```
./mvnw quarkus:add-extension
-Dextensions="kogito"
```

# **Apache Tika**

Quarkus integrets with Apache Tika to detect and extract metadata/text from different file types:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-tika"
```

You can configure Apache Tika in application.properties file by using next properties prefixed with quarkus:

Parameter	Default	Description
tika.tika-config- path	tika-config.xml	Path to the Tika configuration resource.
quarkus.tika.parser	s	CSV of the abbreviated or full parser class to be loaded by the extension.
tika.append-embedde	d- true	The document may have other embedded documents. Set if autmatically append.

# **JGit**

Quarkus integrets with JGit to integrate with Git repositories:

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-jgit"
```

And then you can start using JGit:

When running in native mode, make sure to configure SSL access correctly quarkus.ssl.native=true (Native and SSL).

# Web Resources

You can serve web resources with Quarkus. You need to place web resources at src/main/resources/META-INF/resources and then they are accessible (ie http://localhost:8080/index.html)

By default static resources as served under the root context. You can change this by using quarkus.http.root-path property.

# **Transactional Memory**

Quarkus integrates with the Software Transactional Memory (STM) implementation provided by the Narayana project.

```
./mvnw quarkus:add-extension
-Dextensions="narayana-stm"
```

Transactional objects must be interfaces and annotated with org.jboss.stm.annotations.Transactional.

```
@Transactional
@NestedTopLevel
public interface FlightService {
   int getNumberOfBookings();
   void makeBooking(String details);
}
```

The pessimistic strategy is the default one, you can change to optimistic by using <code>@Optimistic</code>.

Then you need to create the object inside org.jboss.stm.Container.

```
Container<FlightService> container = new Container<>();
FlightServiceImpl instance = new FlightServiceImpl();
FlightService flightServiceProxy = container.create(instance);
```

The implementation of the service sets the locking and what needs to be saved/restored:

```
import org.jboss.stm.annotations.ReadLock;
import org.jboss.stm.annotations.State;
import org.jboss.stm.annotations.WriteLock;

public class FlightServiceImpl
   implements FlightService {
    @State
    private int numberOfBookings;

    @ReadLock
   public int getNumberOfBookings() {
        return numberOfBookings;
    }

    @WriteLock
   public void makeBooking (String details) {
        numberOfBookings += 1;
    }
}
```

Any member is saved/restored automatically (@state is not mandatory). You can use @NotState to avoid behaviour.

#### **Transaction boundaries**

#### Declarative

- @NestedTopLevel: Defines that the container will create a new top-level transaction for each method invocation.
- @Nested: Defines that the container will create a new top-level or nested transaction for each method invocation.

## Programmatically

```
AtomicAction aa = new AtomicAction();

aa.begin();
{
   try {
      flightService.makeBooking("BA123 ...");
      taxiService.makeBooking("East Coast Taxis ...");

      aa.commit();
   } catch (Exception e) {
      aa.abort();
   }
}
```

# Quartz

Quarkus integrates with Quartz to schedule periodic clustered tasks.

```
./mvnw quarkus:add-extension
-Dextensions="quartz"
```

```
@ApplicationScoped
public class TaskBean {

    @Transactional
    @Scheduled(every = "10s")
    void schedule() {

        Task task = new Task();
        task.persist();
    }
}
```

To configure in clustered mode vida DataSource:

```
quarkus.datasource.url=jdbc:postgresql://localhost/quarkus_
test
quarkus.datasource.driver=org.postgresql.Driver
# ...
quarkus.quartz.clustered=true
quarkus.quartz.store-type=db
```

You need to define the datasource used by clustered mode and also import the database tables following the Quartz schema.

# Qute

Qute is a templating engine designed specifically to meet the Quarkus needs. Templates should be placed by default at src/main/resources/templates aand subdirectories.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-resteasy-qute"
```

Templates can be defined in any format, in case of HTML:

#### item.html

First line is not mandatory but helps on doing property checks at compilation time.

To render the template:

```
public class Item {
    public String name;
    public BigDecimal price;
}

@Inject
io.quarkus.qute.Template item;

@GET
@Path("{id}")
@Produces(MediaType.TEXT_HTML)
public TemplateInstance get(@PathParam("id") Integer id) {
    return item.data("item", service.findItem(id));
}

@TemplateExtension
static BigDecimal discountedPrice(Item item) {
    return item.price.multiply(new BigDecimal("0.9"));
}
```

If @ResourcePath is not used in Template then the name of the field is used as file name. In this case the file should be src/main/resources/templates/item.{}. Extension of the file is not required to be set.

discountedPrice is not a field of the POJO but a method call. Method definition must be annotated with @TemplateExtension and be static method. First parameter is used to match the base object (Item). @TemplateExtension can be used at class level:

```
@TemplateExtension
public class MyExtensions {
    static BigDecimal discountedPrice(Item item) {
        return item.price.multiply(new BigDecimal("0.9"));
    }
}
```

Methods with multiple parameters are supported too:

```
{item.discountedPrice(2)}
```

```
static BigDecimal discountedPrice(Item item, int scale) {
   return item.price.multiply(scale);
}
```

Qute for syntax supports any instance of Iterable, Map.EntrySet, Stream Or Integer.

```
{#for i in total}
    {i}:
    {/for}
```

The next map methods are supported:

```
{#for key in map.keySet}
{#for value in map.values}
{map.size}
{#if map.isEmpty}
{map['foo']
```

The next list methods are supported:

```
{list[0]}
```

The next number methods are supported:

```
{#if counter.mod(5) == 0}
```

You can render programmatically the templates too:

```
// file located at src/main/resources/templates/reports/v1/
report_01.{}
@ResourcePath("reports/v1/report_01")
Template report;
String output = report
    .data("samples", service.get())
    .render();
```

# **Reactive and Async**

# **Qute Mail Integration**

```
@Inject
MailTemplate hello;

CompletionStage<Void> c = hello.to("to@acme.org")
    .subject("Hello from Qute template")
    .data("name", "John")
    .send();
```

INFO: Template located at src/main/resources/templates/hello.
[html|txt].

# Sentry

Quarkus integrates with **Sentry** for logging errors into an error monitoring system.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-logging-sentry"
```

And the configuration to send all errors occuring in the package org.example to Sentrty with DSN https://abcd@sentry.io/1234:

```
quarkus.log.sentry=true
quarkus.log.sentry.dsn=https://abcd@sentry.io/1234
quarkus.log.sentry.level=ERROR
quarkus.log.sentry.in-app-packages=org.example
```

Full list of configuration properties having quarkus.log as prefix:

### sentry.enable

Enable the Sentry logging extension (default: false)

#### sentry.dsn

Where to send events.

#### sentry.level

Log level (default: WARN)

#### sentry.in-app-packages

Configure which package prefixes your application uses.

# **JSch**

Quarkus integrates with Jsch for SSH communication.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-jsch"
```

```
JSch jsch = new JSch();
Session session = jsch.getSession(null, host, port);
session.setConfig("StrictHostKeyChecking", "no");
session.connect();
```

# Cache

Quarkus can cache method calls by using as key the tuple (method + arguments).

```
./mvnw quarkus:add-extension
-Dextensions="cache"
```

```
@io.quarkus.cache.CacheResult(cacheName = "weather-cache")
public String getDailyForecast(LocalDate date, String city)
{}
```

@CacheInvalidate removes the element represented by the calculated cache key from cache @CacheInvalidateAll removes all

entries from the cache. @CacheKey to specifically set the arguments to be used as key instead of all.

```
@ApplicationScoped
public class CachedBean {

    @CacheResult(cacheName = "foo")
    public Object load(Object key) {}

    @CacheInvalidate(cacheName = "foo")
    public void invalidate(Object key) {}

    @CacheInvalidateAll(cacheName = "foo")
    public void invalidateAll() {}
}
```

This extension uses Caffeine as its underlying caching provider.

Each cache can be configured individually:

```
quarkus.cache.caffeine."foo".initial-capacity=10
quarkus.cache.caffeine."foo".maximum-size=20
quarkus.cache.caffeine."foo".expire-after-write
quarkus.cache.caffeine."bar".maximum-size=1000
```

Full list of configuration properties having quarkus.cache.caffeine. [cache-name] as prefix:

## initial-capacity

Minimum total size for the internal data structures.

#### maximum-size

Maximum number of entries the cache may contain.

## expire-after-write

Specifies that each entry should be automatically removed from the cache once a fixed duration has elapsed after the entry's creation, or last write.

#### expire-after-access

Specifies that each entry should be automatically removed from the cache once a fixed duration has elapsed after the entry's creation, or last write.

You can multiple cache annotations on a single method.

# Banner

Banner is printed by default. It is not an extension but placed in the core.

### quarkus.banner.path

Path is relative to root of the classpath. (default: default banner.txt)

### quarkus.banner.enabled

Enables banner. (default: true)

# **OptaPlanner**

Quarkus integrates with OptaPlanner.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-optaplanner, quarkus-optaplanner-jackson"
```

```
@PlanningSolution
public class TimeTable {
}

@Inject
private SolverManager<TimeTable, UUID> solverManager;

UUID problemId = UUID.randomUUID();
SolverJob<TimeTable, UUID> solverJob = solverManager.solve (problemId, problem);
TimeTable solution = solverJob.getFinalBestSolution();
```

Possible configuration options prefixed with quarkus.optaplanner:

#### solver-config-xml

A classpath resource to read the solver configuration XML. Not mandatory.

#### solver.environment-mode

Enable runtime assertions to detect common bugs in your implementation during development. Possible values:

FAST\_ASSERT, FULL\_ASSERT, NON\_INTRUSIVE\_FULL\_ASSERT, NON\_REPRODUCIBLE, REPRODUCIBLE. (default: REPRODUCIBLE)

#### solver.move-thread-count

Enable multithreaded solving for a single problem. Possible values: MOVE\_THREAD\_COUNT\_NONE, MOVE\_THREAD\_COUNT\_AUTO, a number or formula based on the available processors. (default: MOVE THREAD COUNT NONE)

## solver.termination.spent-limit

How long the solver can run. (ie 5s)

## solver.termination.unimproved-spent-limit

How long the solver can run without finding a new best solution after finding a new best solution. (ie 2h)

### solver.termination.best-score-limit

Terminates the solver when a specific or higher score has been reached. (ie <code>Ohard/-1000soft</code>)

#### solver-manager.parallel-solver-count

The number of solvers that run in parallel. (default: PARALLEL\_SOLVER\_COUNT\_AUTO)

# **Context Propagation**

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-smallrye-context-propagation"
```

If using mutiny extension together you already get context propagation for ArC, RESTEasy and transactions. With CompletionStage you need to:

```
@Inject ThreadContext threadContext;
@Inject ManagedExecutor managedExecutor;

threadContext.withContextCapture(..)
    .thenApplyAsync(r -> {}, managedExecutor);
```

If you are going to use security in a reactive environment you will likely need Smallrye Content Propagation to propagate the identity throughout the reactive callback.

# **Spring DI**

Quarkus provides a compatibility layer for Spring dependency injection.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-spring-di"
```

Some examples of what you can do. Notice that annotations are the Spring original ones.

```
@Configuration
public class AppConfiguration {

    @Bean(name = "capitalizeFunction")
    public StringFunction capitalizer() {
        return String::toUpperCase;
    }
}
```

Or as a component:

```
@Component("noopFunction")
public class NoOpSingleStringFunction
   implements StringFunction {
}
```

Also as a service and injection properties from application.properties.

```
@Service
public class MessageProducer {
    @Value("${greeting.message}")
    String message;
}
```

And you can inject using Autowired or constructor in a component and in a JAX-RS resource too.

```
@Component
public class GreeterBean {

    private final MessageProducer messageProducer;

    @Autowired @Qualifier("noopFunction")
    StringFunction noopStringFunction;

    public GreeterBean(MessageProducer messageProducer) {
        this.messageProducer = messageProducer;
    }
}
```

# **Spring Boot Configuration**

Quarkus provides a compatibility layer for Spring Boot ConfigurationProperties.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-spring-boot-properties"
```

```
@ConfigurationProperties ("example")
public final class ClassProperties {
    private String value;
    private AnotherClass anotherClass;

// getters/setters
}
```

```
example.value=class-value
example.anotherClass.value=true
```

# **Spring Cloud Config Client**

Quarkus integrates Spring Cloud Config Client and MicroProfile Config spec.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-spring-cloud-config-client"
```

You need to configure the extension:

```
quarkus.spring-cloud-config.uri=http://localhost:8089
quarkus.spring-cloud-config.username=user
quarkus.spring-cloud-config.password=pass
quarkus.spring-cloud-config.enabled=true
```

```
@ConfigProperty(name = "greeting.message")
String greeting;
```

Prefix is quarkus.spring-cloud-config.

### uri

Base URI where the Spring Cloud Config Server is available. (default: localhost:8888)

#### username

Username to be used if the Config Server has BASIC Auth enabled.

#### password

Password to be used if the Config Server has BASIC Auth enabled.

#### enabled

Enables read configuration from Spring Cloud Config Server. (default: false)

#### fail-fast

True to not start application if cannot access to the server. (default: false)

#### connection-timeout

The amount of time to wait when initially establishing a connection before giving up and timing out. (default: 10s)

#### read-timeout

The amount of time to wait for a read on a socket before an exception is thrown. (default: 60s)

# **Spring Web**

Quarkus provides a compatibility layer for Spring Web.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-spring-web"
```

Specifically supports the REST related features. Notice that infrastructure things like BeanPostProcessor will not be executed.

Supported annotations are: RestController, RequestMapping, GetMapping, PostMapping, PutMapping, DeleteMapping, PatchMapping, RequestParam, RequestHeader, MatrixVariable, PathVariable, CookieValue, RequestBody, ResponseStatus, ExceptionHandler and RestControllerAdvice.

If you scaffold the project with <code>spring-web</code> extension, then Spring Web annotations are sed in the generated project.

mvn <code>io.quarkus:quarkus-maven-plugin:1.3.0.Final:create ... - Dextensions="spring-web"."</code>

The next return types are supported: org.springframework.http.ResponseEntity and java.util.Map.

The next parameter types are supported: An Exception argument

dependency).

# **Spring Data JPA**

While users are encouraged to use Hibernate ORM with Panache for Relational Database access, Quarkus provides a compatibility layer for Spring Data JPA repositories.

```
./mvnw quarkus:add-extension
-Dextensions="quarkus-spring-data-jpa"
```

INFO: Of course you still need to add the JDBC driver, and configure it in application.properties.

And then you can inject it either as shown in Spring DI or in Spring Web.

Interfaces supported:

- org.springframework.data.repository.Repository
- org.springframework.data.repository.CrudRepository
- org.springframework.data.repository.PagingAndSortingRepository
- org.springframework.data.jpa.repository.JpaRepository.

INFO: Generated repositories are automatically annotated with @Transactional.

Repository fragments is also supported:

```
public interface PersonRepository
   extends JpaRepository<Person, Long>, PersonFragment {
    void makeNameUpperCase(Person person);
}
```

User defined queries:

```
@Query("select m from Movie m where m.rating = ?1")
Iterator<Movie> findByRating(String rating);

@Modifying
@Query("delete from Movie where rating = :rating")
void deleteByRating(@Param("rating") String rating);

@Query(value = "SELECT COUNT(*), publicationYear FROM Book
GROUP BY publicationYear")
List<BookCountByYear> findAllByPublicationYear2();

interface BookCountByYear {
   int getPublicationYear();

Long getCount();
}
```

What is currently unsupported:

- Methods of org.springframework.data.repository.query.QueryByExampleExecutor
- QueryDSL support
- Customizing the base repository
- java.util.concurrent.Future as return type
- Native and named queries when using @Query

# **Spring Security**

Quarkus provides a compatibility layer for Spring Security.

```
./mvnw quarkus:add-extension
-Dextensions="spring-security"
```

You need to choose a security extension to define user, roles, ... such as openid-connect, oauth2, properties-file Or security-jdbc as seen at RBAC.

Then you can use Spring Security annotations to protect the methods:

```
@Secured("admin")
@GetMapping
public String hello() {
   return "hello";
}
```

Quarkus provides support for some of the most used features of Spring Security's  ${\tt @PreAuthorize}$  annotation.

Some examples:

#### hasRole

• @PreAuthorize("hasRole('admin')")

• @PreAuthorize("hasRole(@roles.USER)") where roles is a bean defined with @component annotation and USER is a public field of the class.

# hasAnyRole

• @PreAuthorize("hasAnyRole(@roles.USER, 'view')")

# **Permit and Deny All**

- @PreAuthorize("permitAll()")
- @PreAuthorize("denyAll()")

# **Anonymous and Authenticated**

- @PreAuthorize("isAnonymous()")
- @PreAuthorize("isAuthenticated()")

## **Expressions**

• Checks if the current logged in user is the same as the username method parameter:

```
@PreAuthorize("#person.name == authentication.principal.use
rname")
public void doSomethingElse(Person person) {}
```

• Checks if calling a method if user can access:

```
@PreAuthorize("@personChecker.check(#person, authenticatio
n.principal.username)")
public void doSomething(Person person) {}

@Component
public class PersonChecker {
    public boolean check(Person person, String username) {
        return person.getName().equals(username);
    }
}
```

• Combining expressions:

```
@PreAuthorize("hasAnyRole('user', 'admin') AND #user == pri
ncipal.username")
public void allowedForUser(String user) {}
```
